A man in a white shirt and red tie is holding a large red cable that arches across the top of the frame. The background is a colorful, abstract landscape with yellow, blue, and green sections. The title text is overlaid on a dark blue area at the bottom.

Cisco Router Configuration and Management

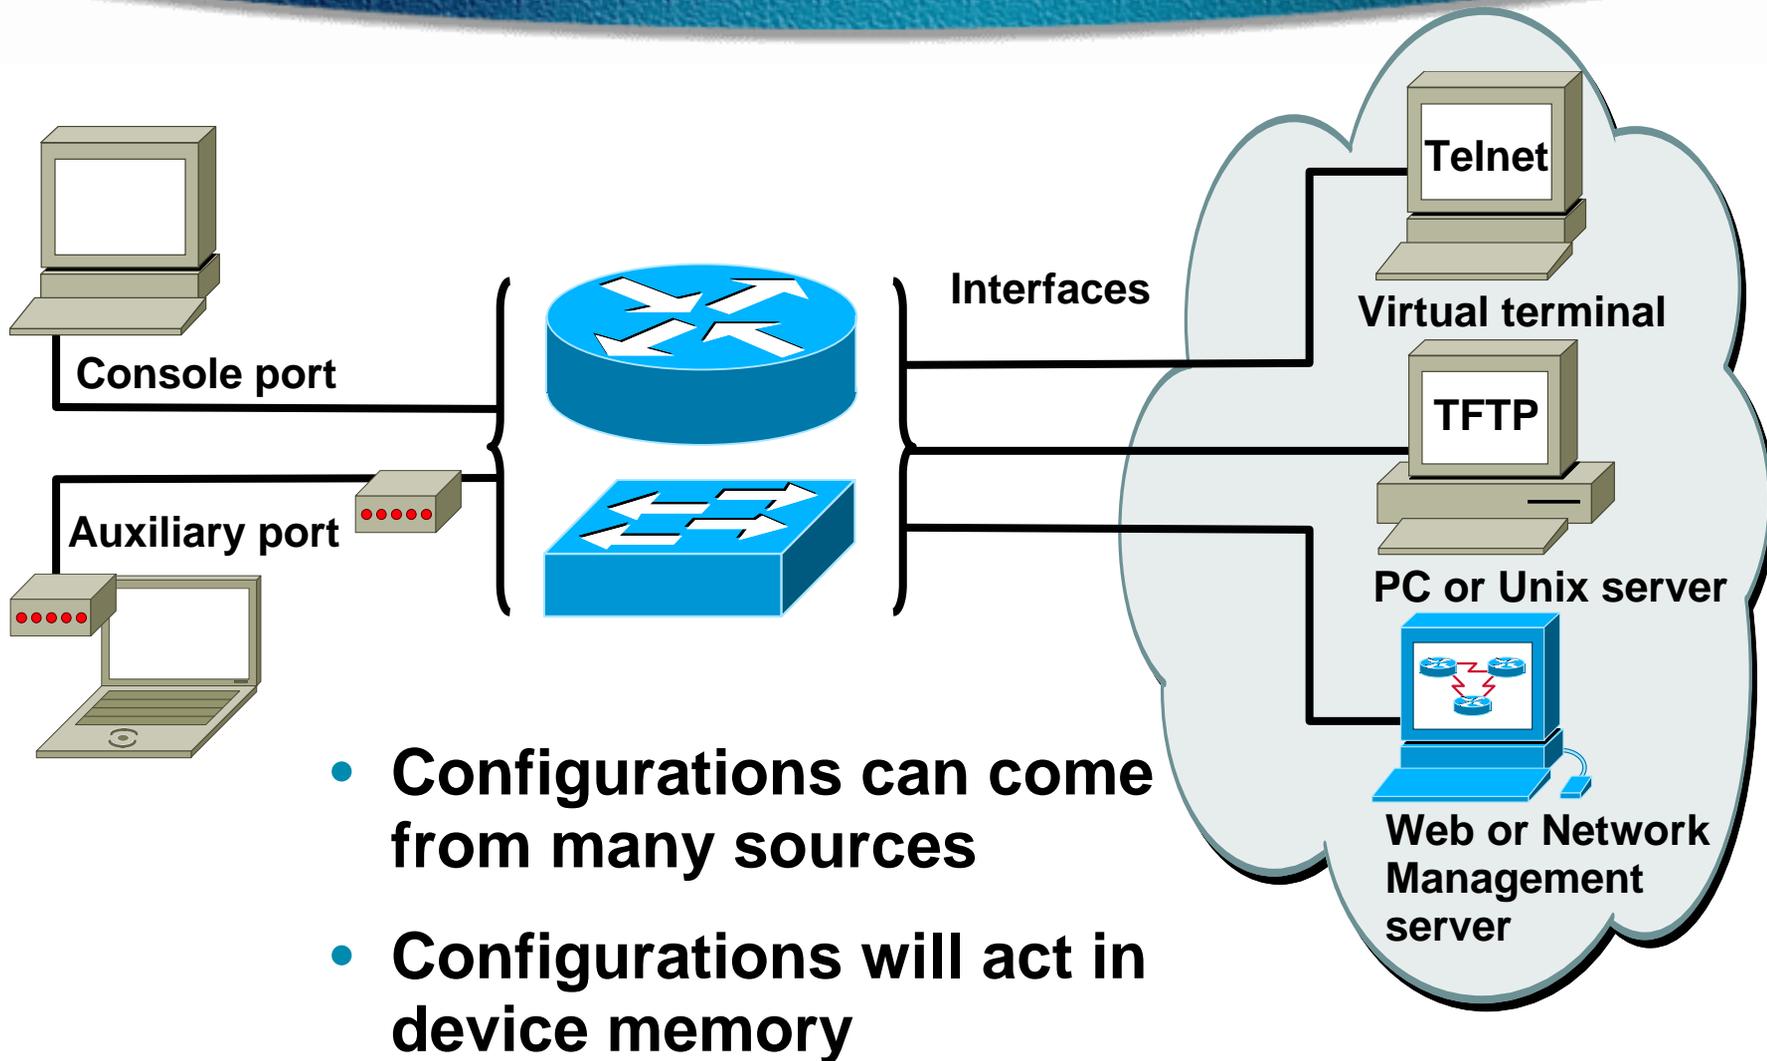

Agenda

- **Router Management**
- **Introduction to Routing Protocols**
- **Access-list**
- **Network Address Translation**
- **Troubleshooting Tools**

Router Management

External Configuration Sources

Creating a HyperTerminal Session

Step 1: Verify cabling

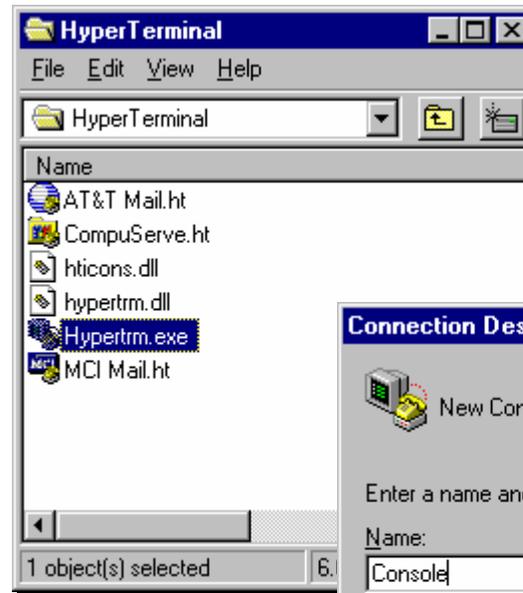

Step 2: Power on PC

Step 3: Open HyperTerminal Folder

Step 4: Open HyperTerminal

Step 5: Describe Connection

Step 3 and 4

Step 5

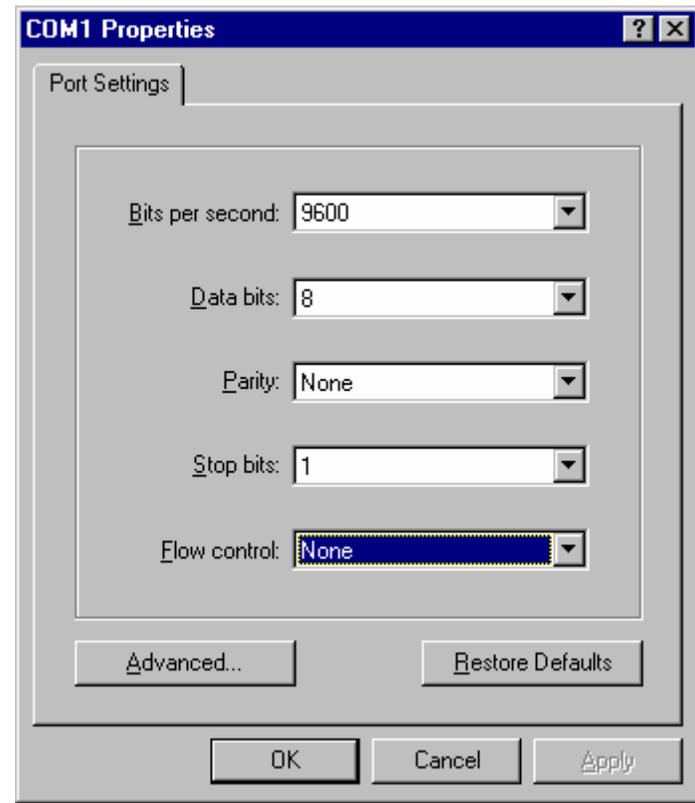

Creating a HyperTerminal Session (cont.)

Step 6: Select COM port to be used

The 'Phone Number' dialog box is shown. It has a title bar with a question mark and a close button. Below the title bar is a 'Console' icon and the text 'Console'. The main area contains the instruction 'Enter details for the phone number that you want to dial:'. There are four input fields: 'Country code' with a dropdown menu showing 'United States of America (1)', 'Area code' with the text '408', 'Phone number' which is empty, and 'Connect using' with a dropdown menu showing 'Direct to Com 1'. At the bottom are 'OK' and 'Cancel' buttons.

Step 7: Select properties

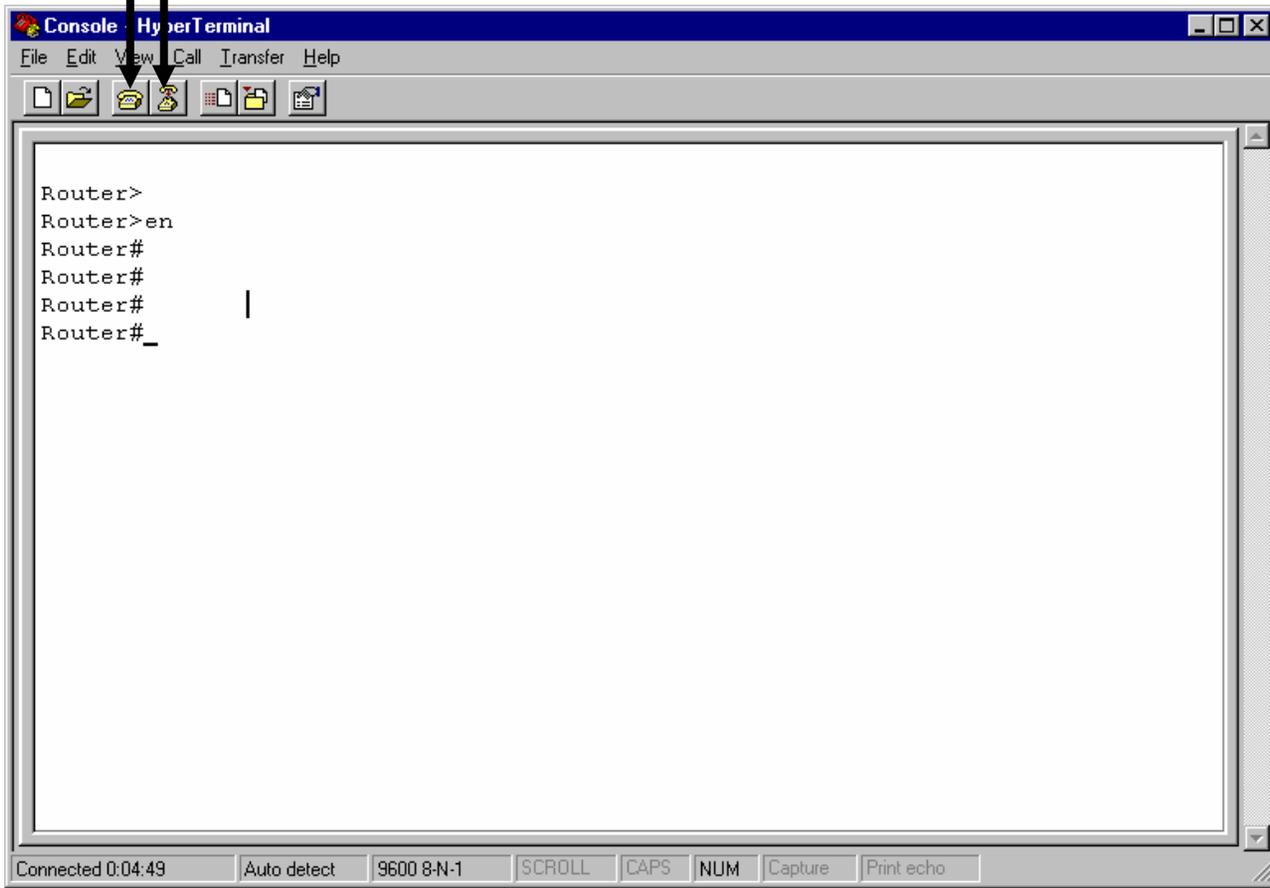

The 'COM1 Properties' dialog box is shown. It has a title bar with a question mark and a close button. The 'Port Settings' tab is selected. The main area contains several settings: 'Bits per second' with a dropdown menu showing '9600', 'Data bits' with a dropdown menu showing '8', 'Parity' with a dropdown menu showing 'None', 'Stop bits' with a dropdown menu showing '1', and 'Flow control' with a dropdown menu showing 'None'. At the bottom are 'Advanced...', 'Restore Defaults', 'OK', 'Cancel', and 'Apply' buttons.

Creating a HyperTerminal Session (cont.)

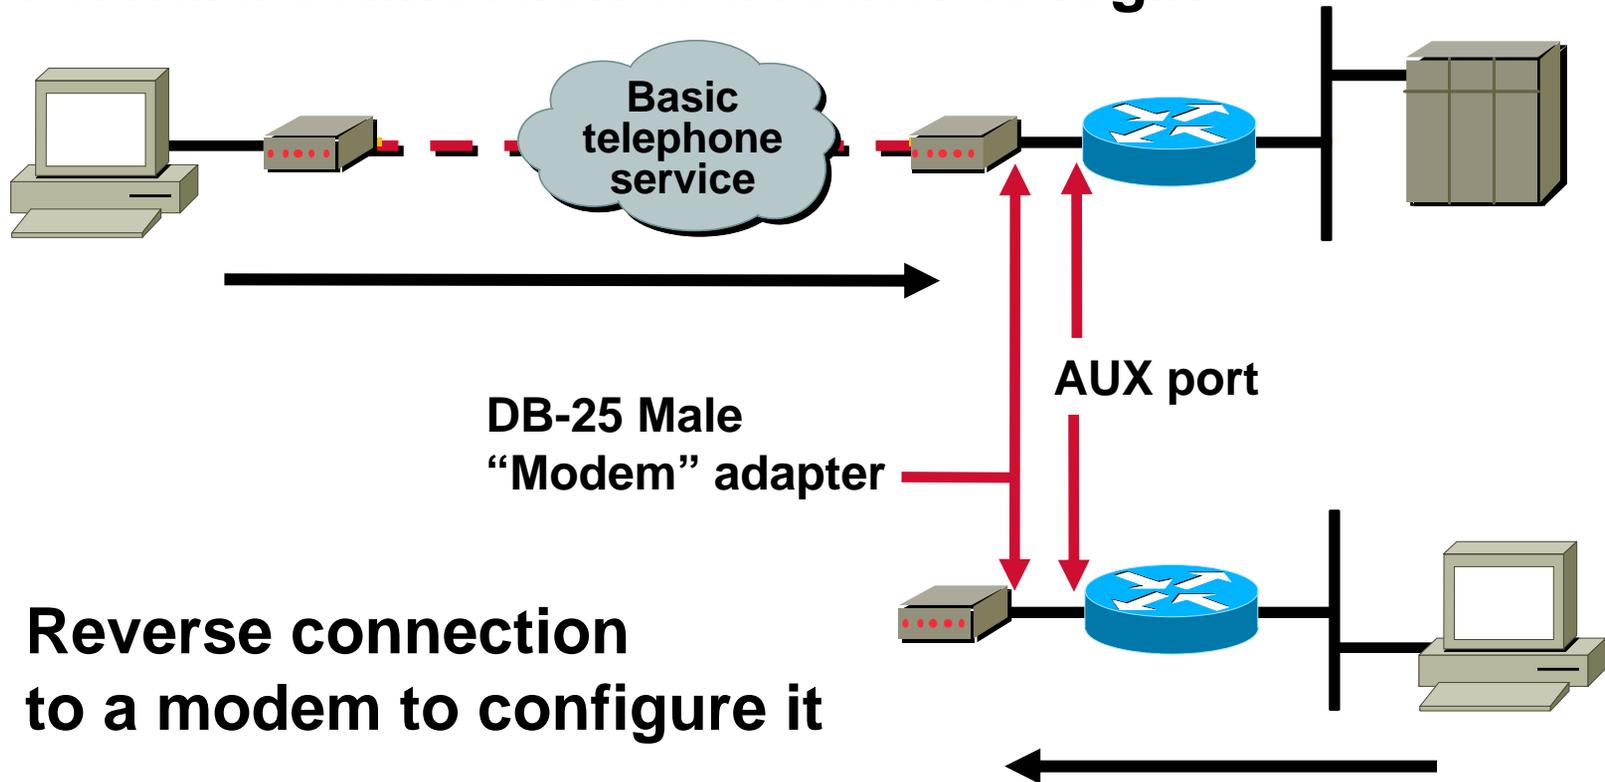

Step 8: Access Device

Connect — Disconnect

Connecting to the Modem

Forward connection to a router to login

**Reverse connection
to a modem to configure it**

Sample Output for *show line*

cherub:18> sh line

EXEC Connection Commands

```
Router>telnet [host][2000+aux_tty#]
```

- Makes a connection with the Telnet protocol

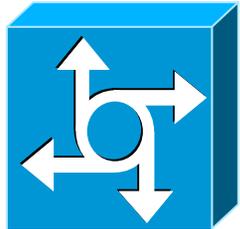

```
Router>disconnect [session-number]
```

- Disconnects the specified session or all sessions

```
Router>ctrl-shift-6 x
```

- Suspends a session

Interface AUX and Line Configuration

Physical configuration

```
Router(config)#line 17
Router(config-line)#modem inout
Router(config-line)#transport input all
Router(config-line)#flowcontrol hardware
```

Standard Modem Commands

Action intended

Loads factory default settings

Auto answer

CD truly reflects line state

Hangs up at DTR low

Ignore “+++” (in-band signaling)

Cisco Internetwork Operating System (IOS) Software

Cisco's IOS software delivers network services and enables networked applications.

Cisco IOS Software EXEC

There are two main EXEC modes for entering commands.

First mode:

User Mode

- Limited examination of switch or router
- Command Prompt is `hostname>`

Cisco IOS Software EXEC (cont.)

Second mode (and most commonly used):

Privileged (or enabled) Mode

- Detailed examination of switch or router
- Enables configuration and debugging
- Prerequisite for other configuration modes
- Command prompts on the device

`hostname#`

Initial Start Up of the Cisco Router

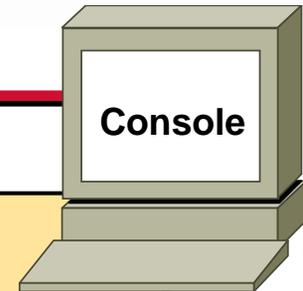

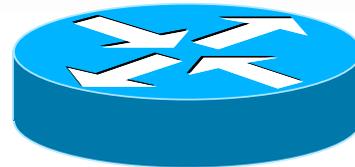

- **System startup routines initiate router software**
- **Router falls back to startup alternatives if needed**

1. **Before you start the router, verify the power, cabling, and console connection**
2. **Push the power switch to on**
3. **Observe the boot sequence**

Cisco IOS software output text on the console

BootUp Output from the Router

--- System Configuration Dialog ---

Continue with configuration dialog? [yes/no]:yes

At any point you may enter a question mark '?' for help.

Use ctrl-c to abort configuration dialog at any prompt

Default settings are in square brackets '[']'.

Setup mode

wg_ro con0 is now available

Press RETURN to get started.

wg_ro>

User-mode
prompt

Unconfigured versus configured router

Setup: The Initial Configuration Dialog

Router#**setup**

--- System Configuration Dialog ---

Continue with configuration dialog? [yes/no]: y

At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.

Basic management setup configures only enough connectivity
for management of the system, extended setup will ask you
to configure each interface on the system

Would you like to enter basic management setup? [yes/no]: n

Setup Interface Summary

First, would you like to see the current interface summary? [yes]:

Interface	IP-Address	OK?	Method	Status	Protocol
BRI0	unassigned	YES	unset	administratively down	down
BRI0:1	unassigned	YES	unset	administratively down	down
BRI0:2	unassigned	YES	unset	administratively down	down
Ethernet0	unassigned	YES	unset	administratively down	down
Serial0	unassigned	YES	unset	administratively down	down

Interfaces found during startup

Setup Global Parameters

Configuring global parameters:

Enter host name [Router]: **wg_ro**

The enable secret is a password used to protect access to privileged EXEC and configuration modes. This password, after entered, becomes encrypted in the configuration.

Enter enable secret: **cisco**

The enable password is used when you do not specify an enable secret password, with some older software versions, and some boot images.

Enter enable password: **sanfran**

The virtual terminal password is used to protect access to the router over a network interface.

Enter virtual terminal password: **sanjose**

Configure SNMP Network Management? [no]:

Initial global parameters

Logging into the Router

wg_ro con0 is now available
Press RETURN to get started.

wg_ro>

wg_ro>logout

Router User Mode Command List

wg_ro>?

Exec commands:

access-enable Create a temporary Access-List entry
atmsig Execute Atm Signalling Commands
cd Change current device
clear Reset functions
connect Open a terminal connection
dir List files on given device
disable Turn off privileged commands
disconnect Disconnect an existing network connection
enable Turn on privileged commands
exit Exit from the EXEC
help Description of the interactive help system
lat Open a lat connection
lock Lock the terminal
login Log in as a particular user
logout Exit from the EXEC
-- More --

**You can abbreviate a command to the fewest characters
that make a unique character string**

Router Privileged Mode Command List

wg_ro#?

Exec commands:

access-enable Create a temporary Access-List entry
access-profile Apply user-profile to interface
access-template Create a temporary Access-List entry
bfe For manual emergency modes setting
cd Change current directory
clear Reset functions
clock Manage the system clock
configure Enter configuration mode
connect Open a terminal connection
copy Copy from one file to another
debug Debugging functions (see also 'undebug')
delete Delete a file
dir List files on a filesystem
disable Turn off privileged commands
disconnect Disconnect an existing network connection
enable Turn on privileged commands
erase Erase a filesystem
exit Exit from the EXEC
help Description of the interactive help system

Configuring Router Identification

Router Name

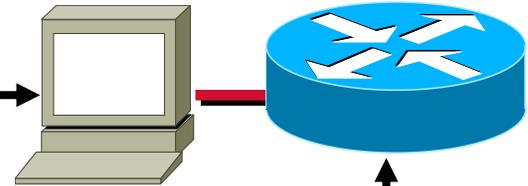

```
Router(config)#hostname wg_ro  
wg_ro(config)#
```

Message of the Day Banner

```
wg_ro(config)#banner motd #  
    Accounting Department  
    You have entered a secured  
    system. Authorized access  
    only! #
```

Interface Description

```
wg_ro(config)#interface ethernet 0  
wg_ro(config-if)#description Engineering LAN, Bldg. 18
```

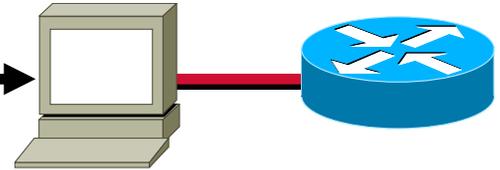

- Sets local identity or message for the accessed router or interface

Router Password Configuration

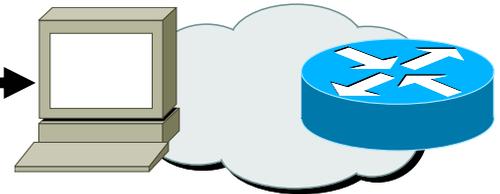

Console Password

```
Router(config)#line console 0  
Router(config-line)#login  
Router(config-line)#password cisco
```

Virtual Terminal Password

```
Router(config)#line vty 0 4  
Router(config-line)#login  
Router(config-line)#password sanjose
```

Enable Password

```
Router(config)#enable password cisco
```

Secret Password

```
Router(config)#enable secret sanfran
```

Configuring an Interface

```
Router(config)#interface type number  
Router(config-if)#
```

- *type* includes serial, ethernet, token ring, fddi, hssi, loopback, dialer, null, async, atm, bri, and tunnel
- *number* is used to identify individual interfaces

```
Router(config)#interface type slot/port  
Router(config-if)#
```

- For modular routers

```
Router(config-if)#exit
```

- Quit from current interface configuration mode

Disabling or Enabling an Interface

```
Router#configure term
Router(config)#interface serial 0
Router(config-if)#shutdown
%LINK-5-CHANGED: Interface Serial0, changed state to administratively down
%LINEPROTO-5-UPDOWN: Line protocol on Interface Serial0, changed state to down
```

Administratively turns off an interface

```
Router#configure term
Router(config)#interface serial 0
Router(config-if)#no shutdown
%LINK-3-UPDOWN: Interface Serial0, changed state to up
%LINEPROTO-5-UPDOWN: Line Protocol on Interface Serial0, changed state to up
```

Enables an interface that is administratively shutdown

Router *show interfaces* Command

Router#**show interfaces**

Ethernet0 is **up**, line protocol is **up**

Hardware is Lance, address is 00e0.1e5d.ae2f (bia 00e0.1e5d.ae2f)

Internet address is 10.1.1.11/24

MTU 1500 bytes, BW 10000 Kbit, DLY 1000 usec, **rely 255/255, load 1/255**

Encapsulation ARPA, loopback not set, keepalive set (10 sec)

ARP type: ARPA, ARP Timeout 04:00:00

Last input 00:00:07, output 00:00:08, output hang never

Last clearing of "show interface" counters never

Queueing strategy: fifo

Output queue 0/40, 0 drops; input queue 0/75, **0 drops**

5 minute **input rate 0 bits/sec, 0 packets/sec**

5 minute **output rate 0 bits/sec, 0 packets/sec**

81833 **packets input**, 27556491 bytes, 0 no buffer

Received 42308 broadcasts, 0 runts, 0 giants, 0 throttles

1 input errors, 0 **CRC**, 0 frame, 0 overrun, 1 ignored, 0 abort

0 input packets with dribble condition detected

55794 **packets output**, 3929696 bytes, 0 underruns

0 output errors, 0 collisions, 1 interface resets

0 babbles, 0 late collision, 4 deferred

0 lost carrier, 0 no carrier

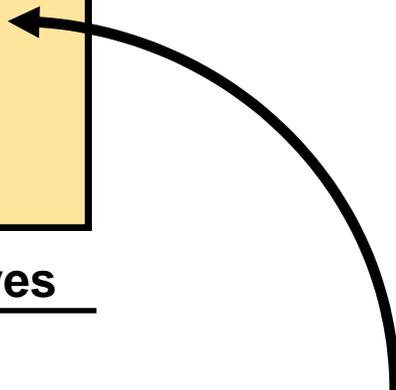

0 output buffer failures, 0 output buffers swapped out

Interpreting Interface Status

```
Router#show interfaces serial 1  
Serial1 is up, line protocol is up  
Hardware is HD64570  
Description: 64Kb Line to San Jose  
:: :: :: :: :: :: :: :: :: ::
```

Carrier Detect

Keepalives

Operational.....	Serial1 is up, line protocol is up
Connection problem...	Serial1 is up, line protocol is down
Interface problem.....	Serial1 is down, line protocol is down
Disabled	Serial1 is administratively down, line protocol is down

Configuring SNMP

```
Router#configure term
```

```
Router(config)# snmp-server community string [view view-name] [ro | rw] [acl_number]
```

Defines the community access string

```
Router#configure term
```

```
Router(config)# snmp-server host host-id [traps | informs][version {1 | 2c | 3 [auth | noauth | priv]} ]  
community-string [udp-port port-number] [notification-type]
```

Specifies the recipient (host) of the notifications

show snmp Command

Router#**sh snmp**

337739 SNMP packets input

0 Bad SNMP version errors

10 Unknown community name

0 Illegal operation for community name supplied

0 Encoding errors

1283846 Number of requested variables

0 Number of altered variables

332559 Get-request PDUs

5170 Get-next PDUs

0 Set-request PDUs

341921 SNMP packets output

0 Too big errors (Maximum packet size 1500)

1685 No such name errors

0 Bad values errors

0 General errors

337729 Response PDUs

4192 Trap PDUs

SNMP logging: enabled

Logging to 10.10.19.241.162, 0/10, 3995 sent, 197 dropped.

Introduction to Routing Protocol

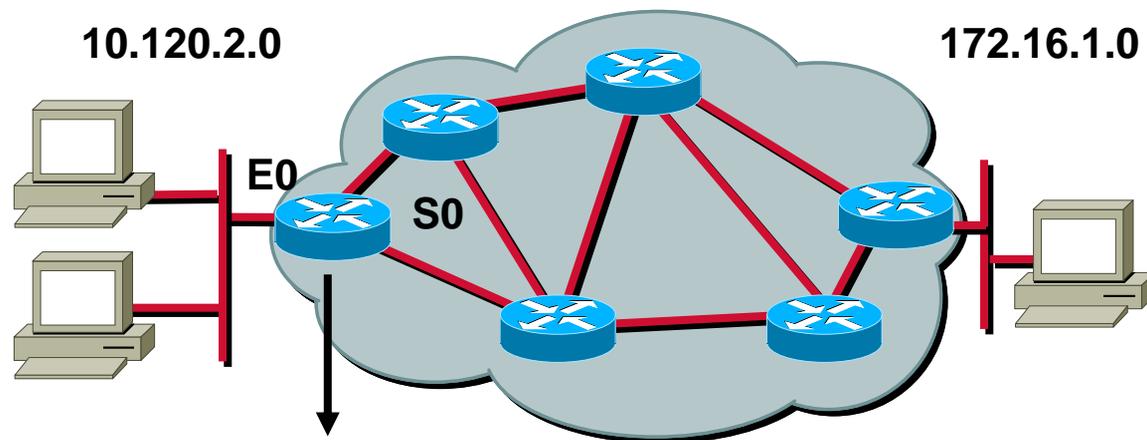

Introduction to Routing Protocol

- **Type of Routing Protocol**
- **Routing Information Protocol**
- **Enhanced IGRP**
- **OSPF**

What Is Routing?

- **Routing is the process of forwarding an item from one location to another**
- **Routers forward traffic to a logical destination in a computer network**
- **Routers perform two major functions:**
 - **Routing**
 - **Learning the logical topology of the network**
 - **Switching**
 - **Forwarding packets from an inbound interface to an outbound interface**

What is Routing? (cont.)

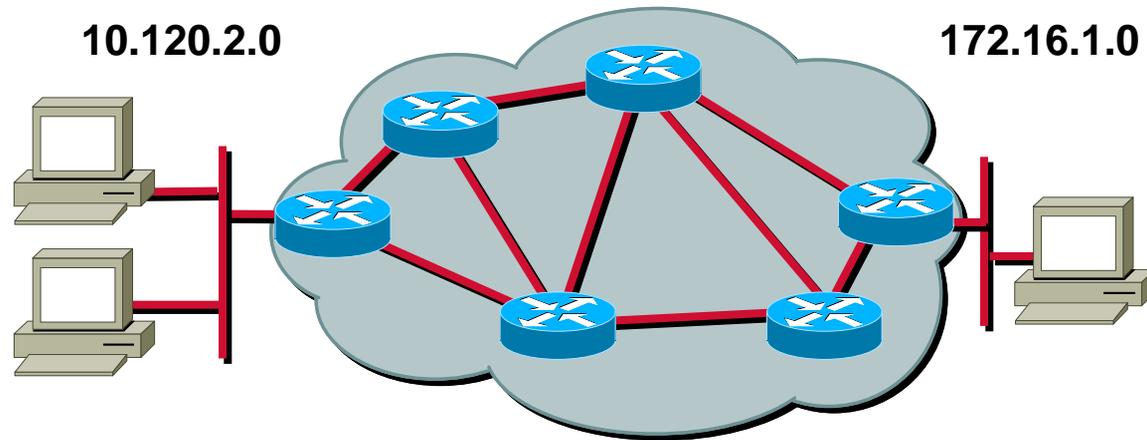

Network Protocol	Destination Network	Exit Interface
Connected	10.120.2.0	E0
Learned	172.16.1.0	S0

Routed Protocol: IP

- Routers must learn destinations that are not directly connected

Routing Requirements

To route a router need to know:

- Destination addresses
- Sources it can learn from
- Possible routes
- Best route
- Maintain and verify routing information

Identifying Static and Dynamic Routes

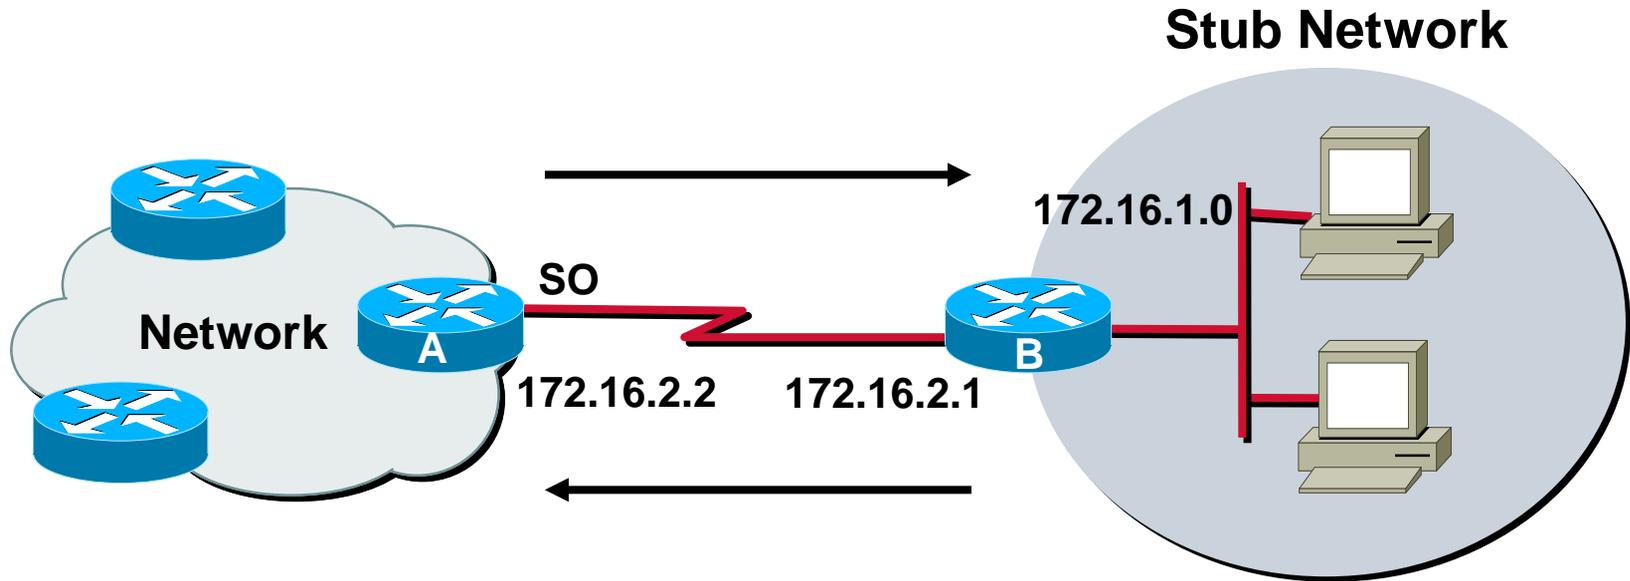

Static Route

Uses a route that a network administrator enters into the router manually

Dynamic Route

Uses a route that a network routing protocol adjusts automatically for topology or traffic changes

Static Routes

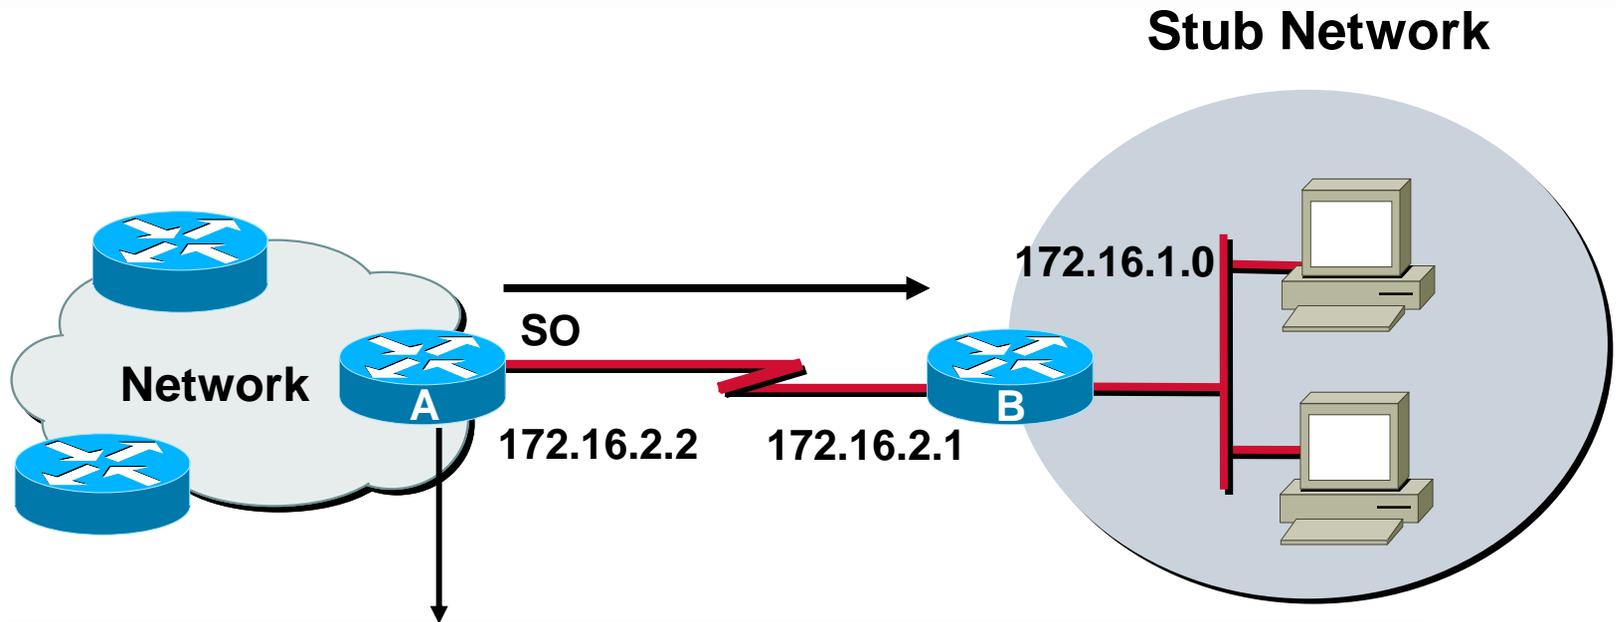

Configure unidirectional static routes to and from a stub network to allow communications to occur.

Static Route Configuration

```
Router(config)#ip route network mask {address / interface}  
[distance] [permanent]
```

Defines a path to an IP destination network or subnet

Static Route Example

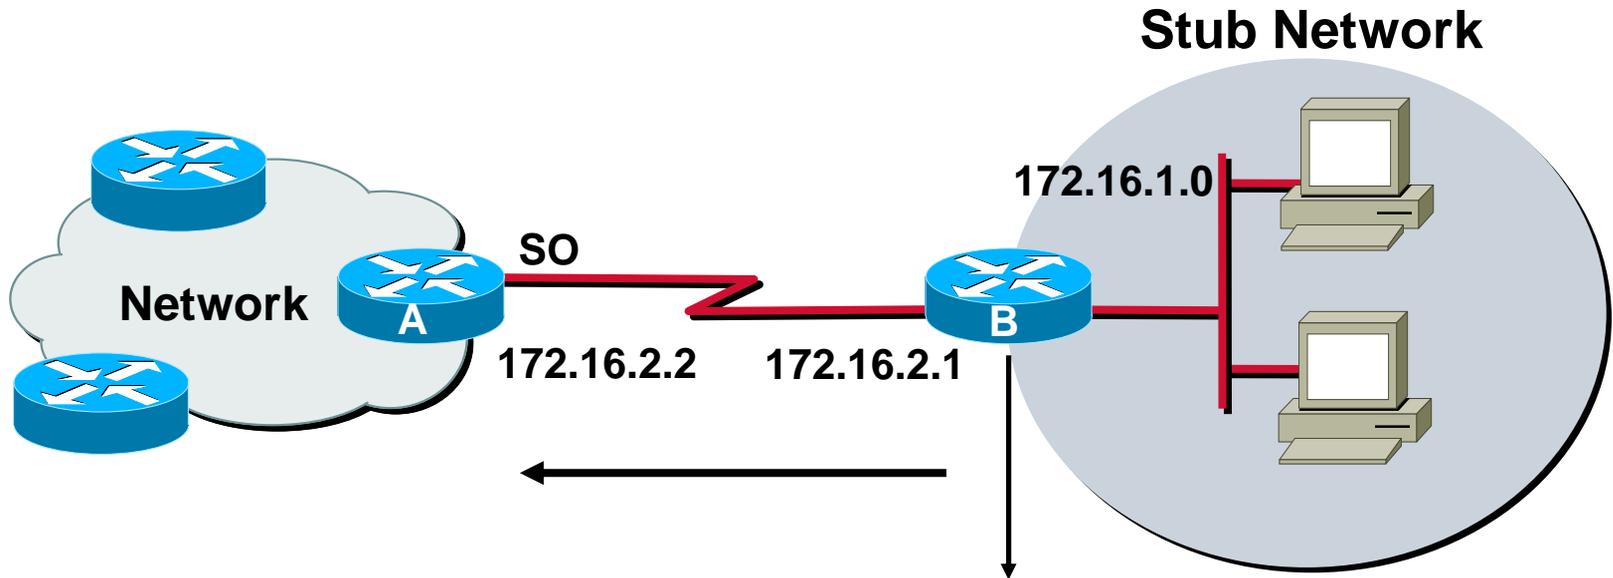

```
Router(config)#
```

```
Router(config)#ip route 172.16.1.0 255.255.255.0 172.16.2.1
```

This is a unidirectional route. You must have a route configured in the opposite direction.

Default Routes

```
Router(config)#
```

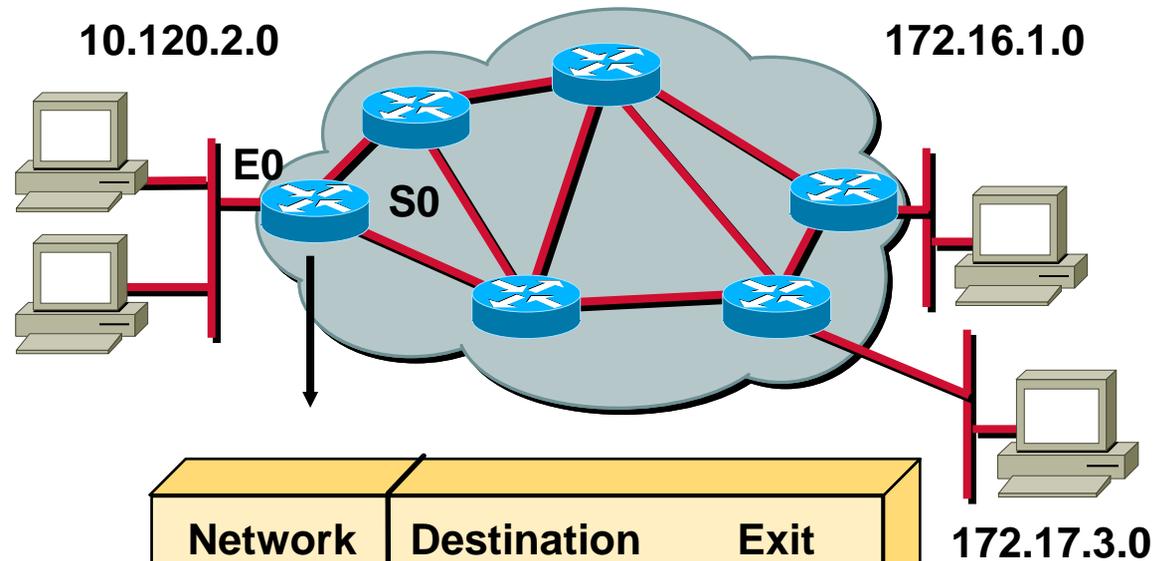

```
Router(config)#ip route 0.0.0.0 0.0.0.0 172.16.2.2
```

This route allows the stub network to reach all known networks beyond router A.

What is a Routing Protocol?

Routing protocols are used between routers to determine paths and maintain routing tables.

Once the path is determined a router can route a **routed** protocol.

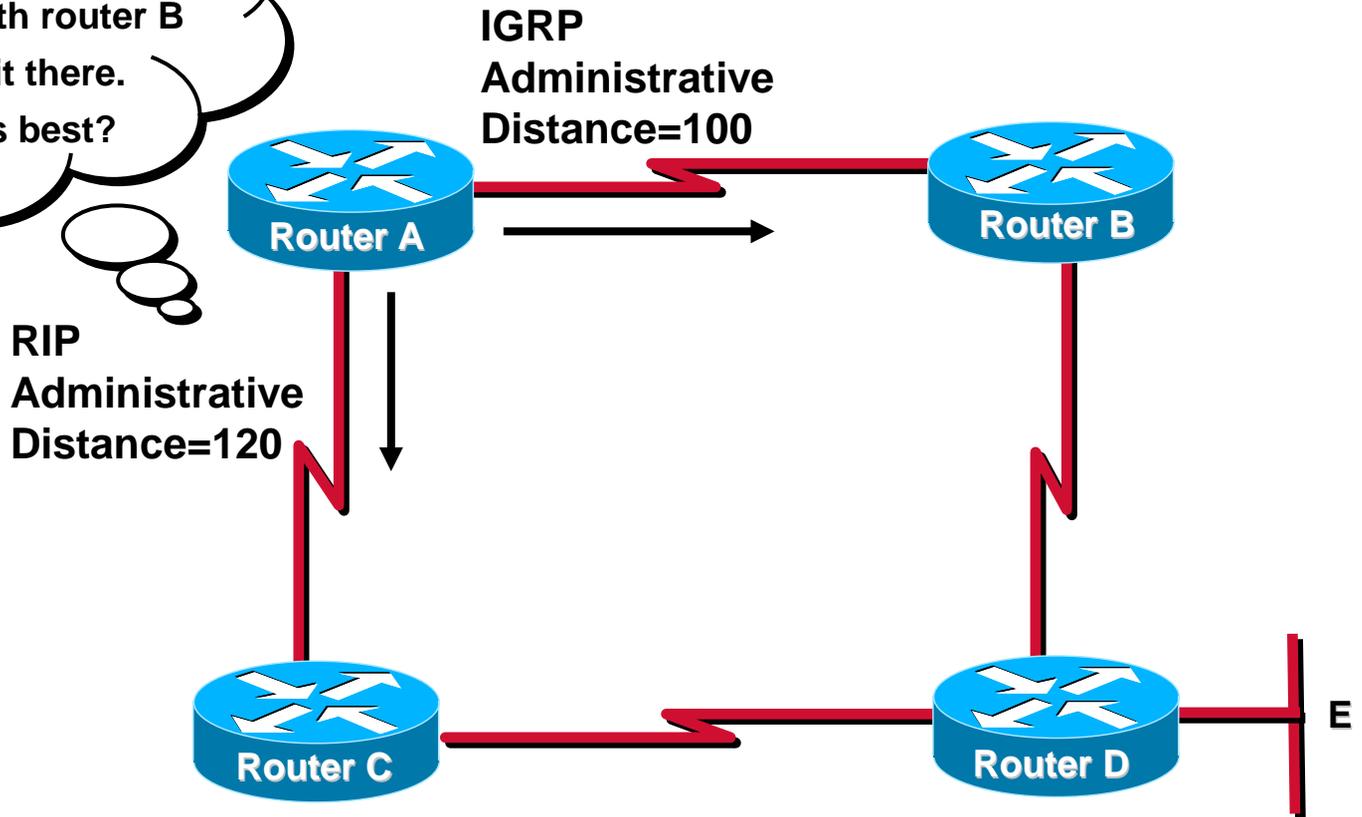

Network Protocol	Destination Network	Exit Interface
Connected	10.120.2.0	E0
RIP	172.16.2.0	S0
IGRP	172.17.3.0	S1

Routed Protocol: IP/IPX

Routing protocol: RIP, IGRP, OSPF

Administrative Distance: Ranking Routes

I need to send a packet to Network E. Both router B and C will get it there. Which route is best?

Administrative Distance

- **Administrative distance is a selection method for IP routing protocols**
- **The lower the administrative distance, the more trusted the learning mechanism**
 - **Manually entered routes are preferred to dynamically learned routes**
 - **Routing protocols with sophisticated metrics are preferred over protocols with simple metric structures**

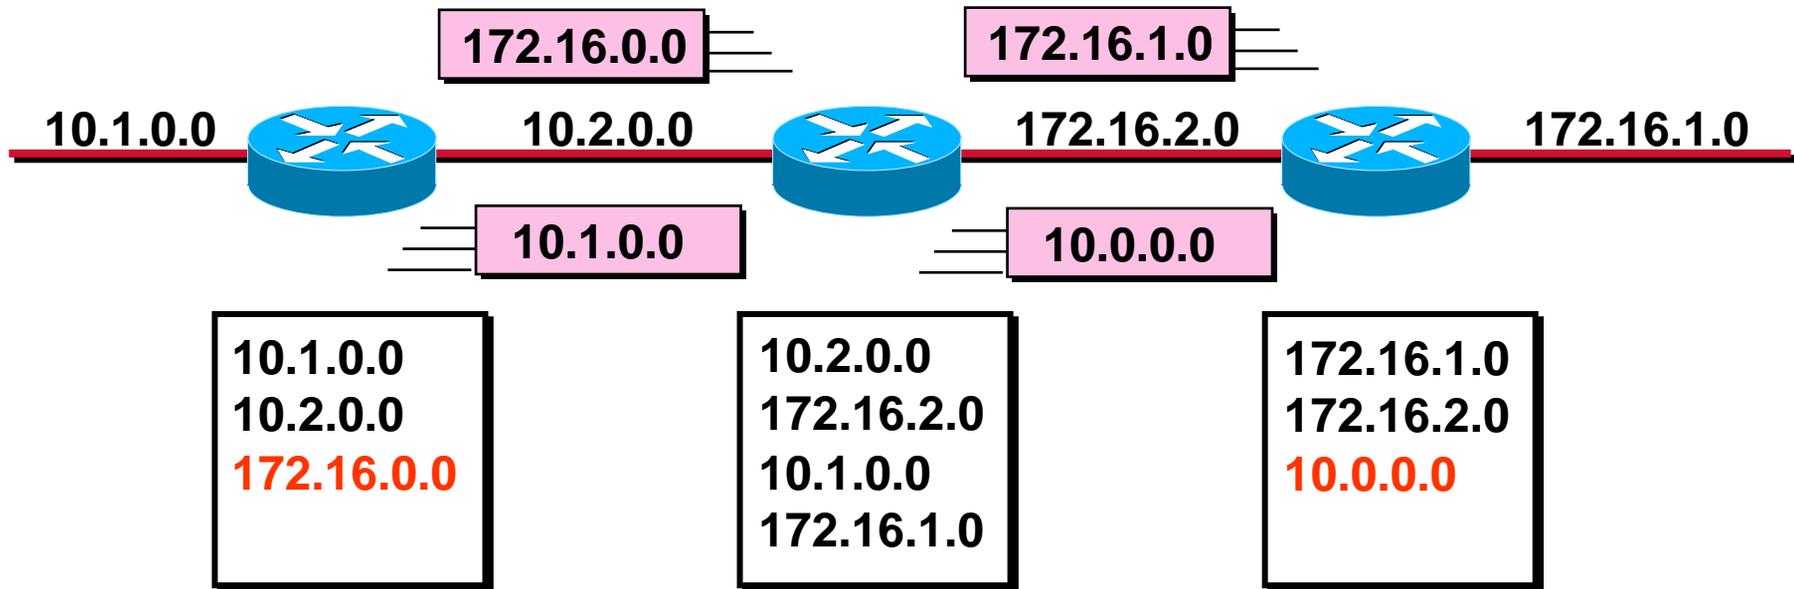

Administrative Distance Comparison Chart

Route Source	Default Distance
Connected interface	0
Static route out an interface	0
Static route to a next hop	1
EIGRP summary route	5
External BGP	20
Internal EIGRP	90
IGRP	100
OSPF	110
IS-IS	115
RIP v1, v2	120
EGP	140
External EIGRP	170
Internal BGP	200
Unknown	255

Classful Routing Overview

- **Classful routing protocols are a consequence of the distance vector method of route calculation**
 - **RIPv1**
 - **IGRP**
- **Routing masks are not carried within the periodic routing updates**
 - **Within a network, consistency of masks is assumed**

Classful Routes

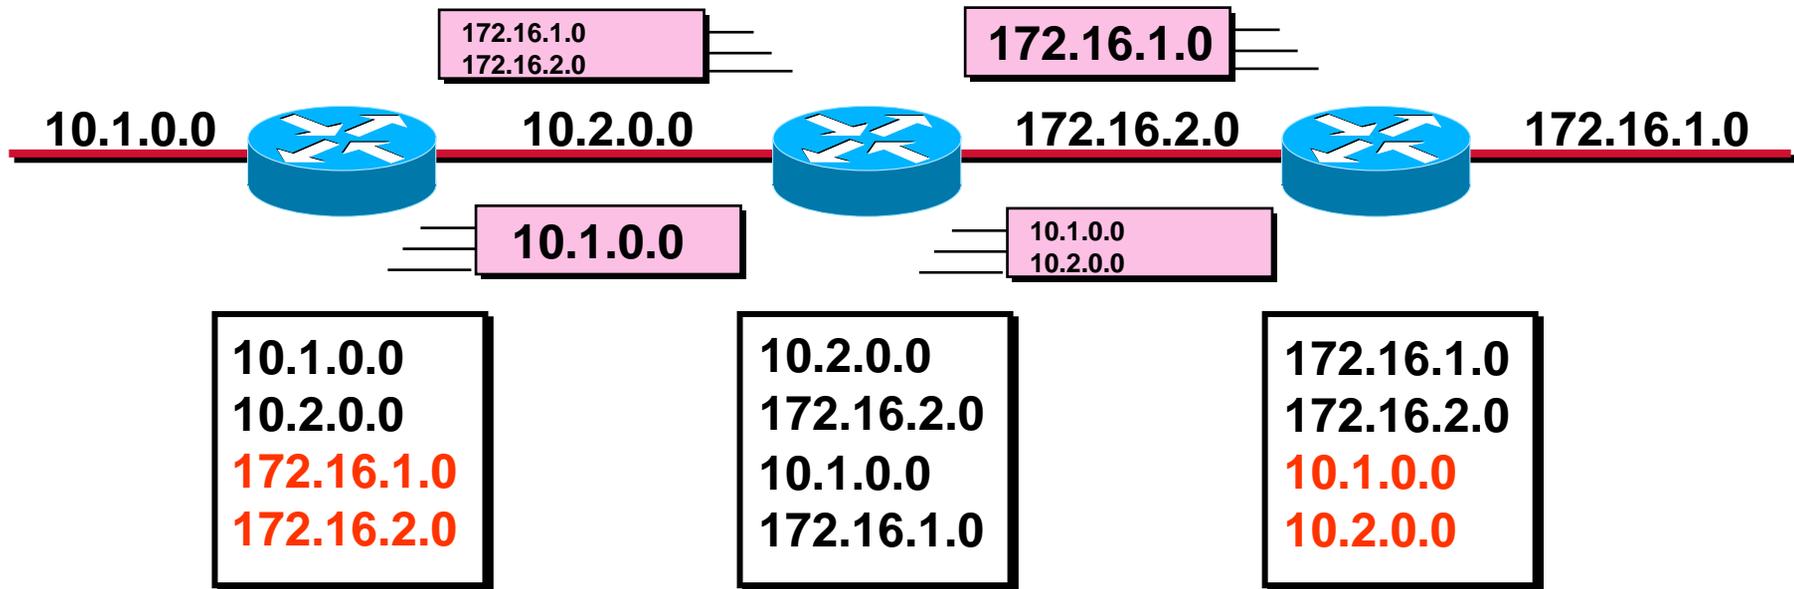

- Subnetwork routes are shared by devices within the same network
- Summary routes are exchanged between foreign networks
 - Summary routes are automatically created at Class A, B, and C network boundaries

Classless Routing Overview

- **Classless routing protocols include the routing mask with the route advertisement**
 - **OSPF**
 - **EIGRP**
 - **RIPv2**
 - **IS-IS**
 - **BGP**
- **Summary routes can be manually controlled within the network**

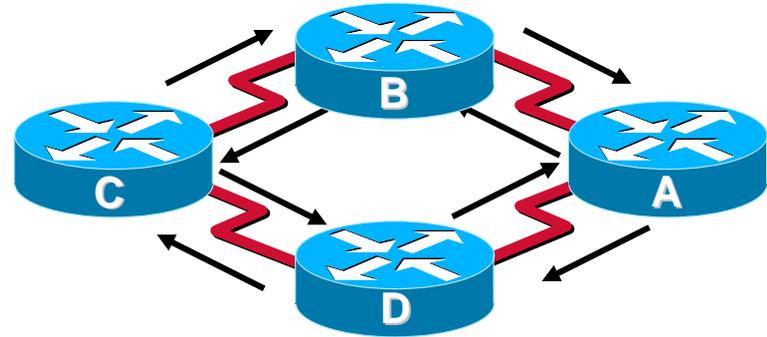

Classless Routes

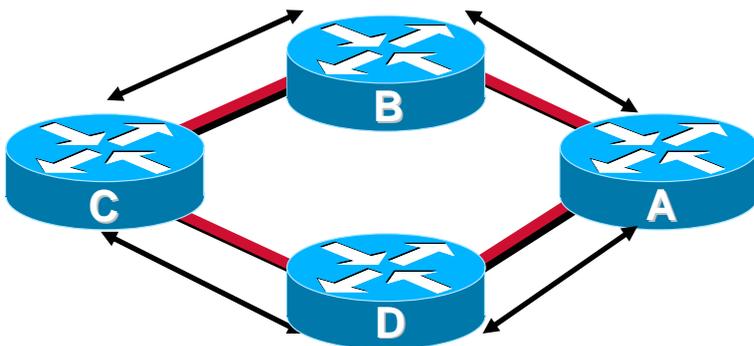

- Subnetwork routes are shared by devices within the same network
- Summary routes are exchanged between foreign networks
 - Summary routes are automatically created at Class A, B, and C network boundaries

Classes of Routing Protocols

Distance Vector

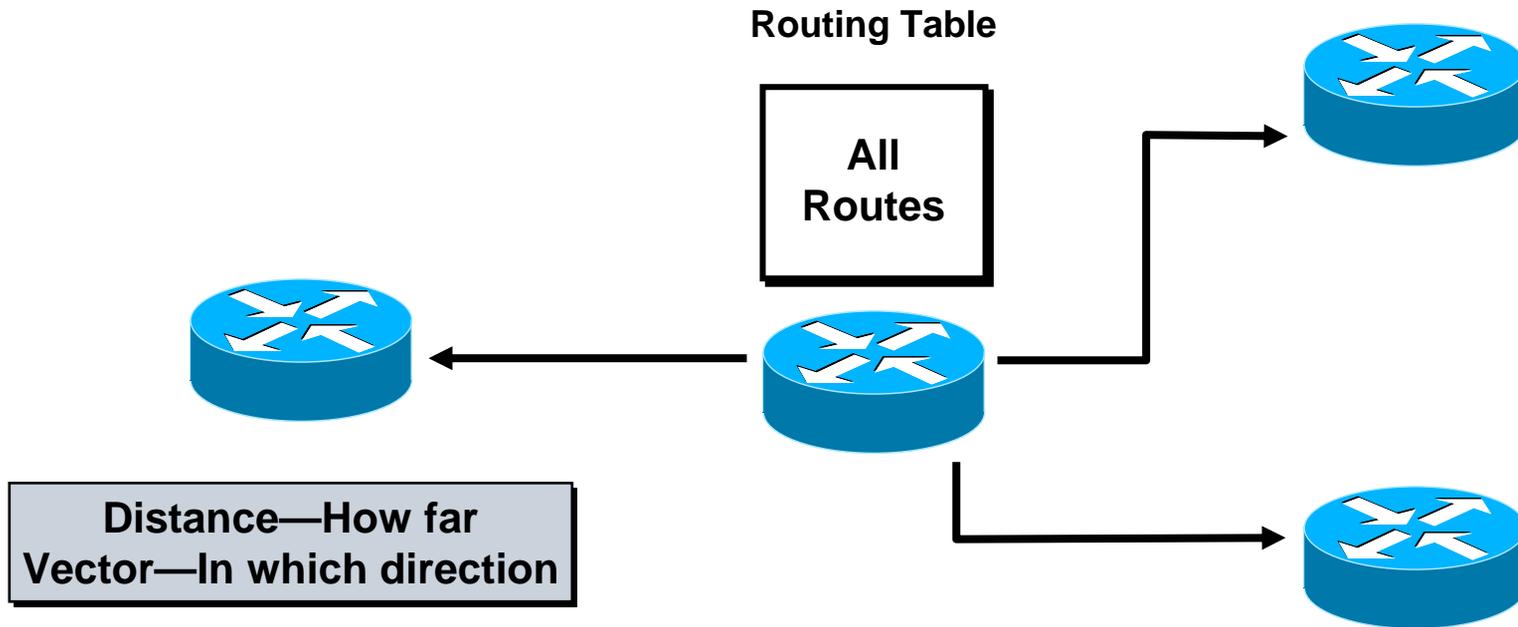

Hybrid Routing

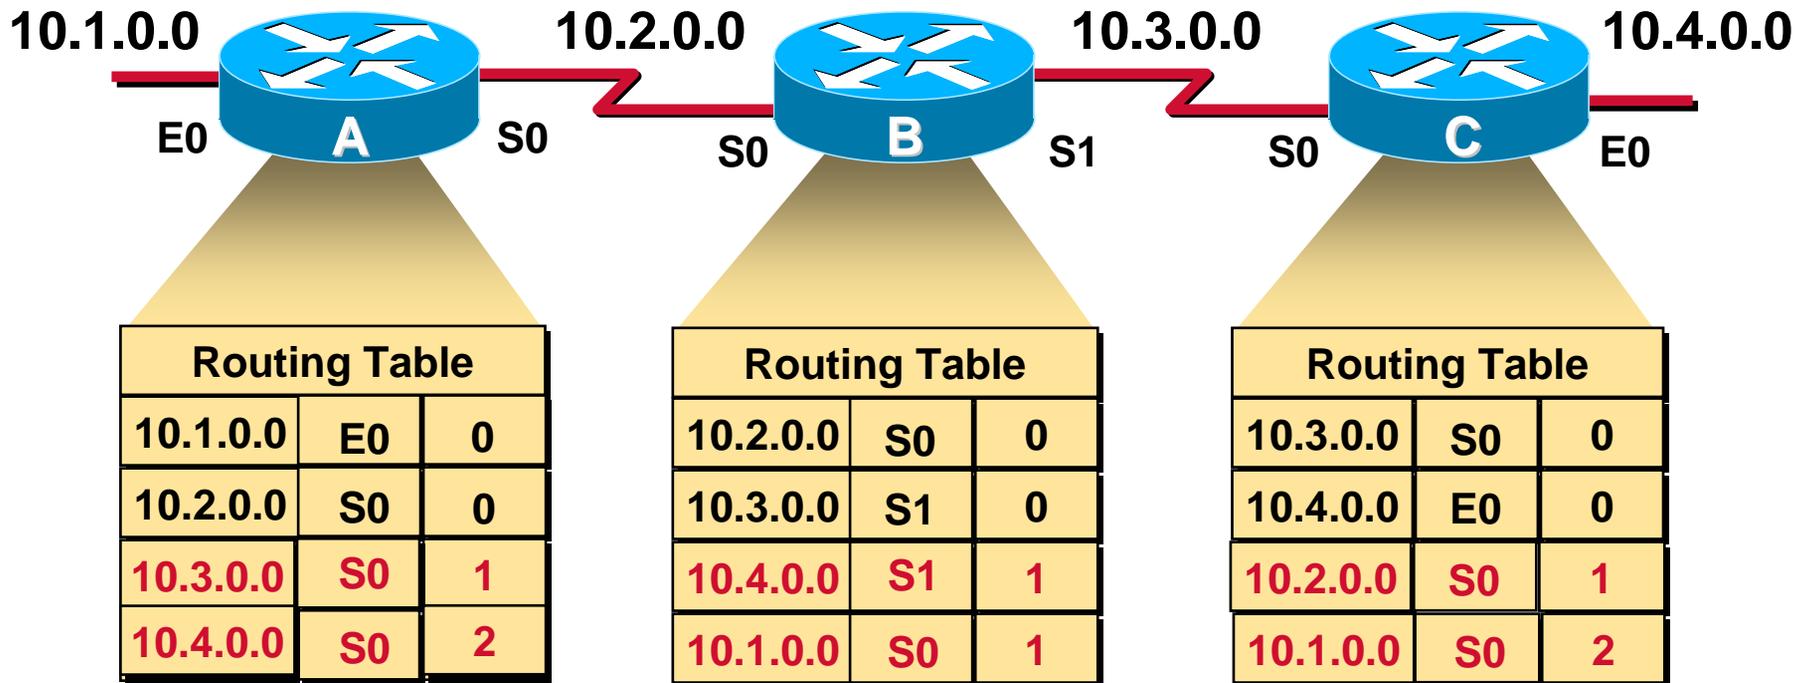

Link State

Distance Vector Routing Protocols

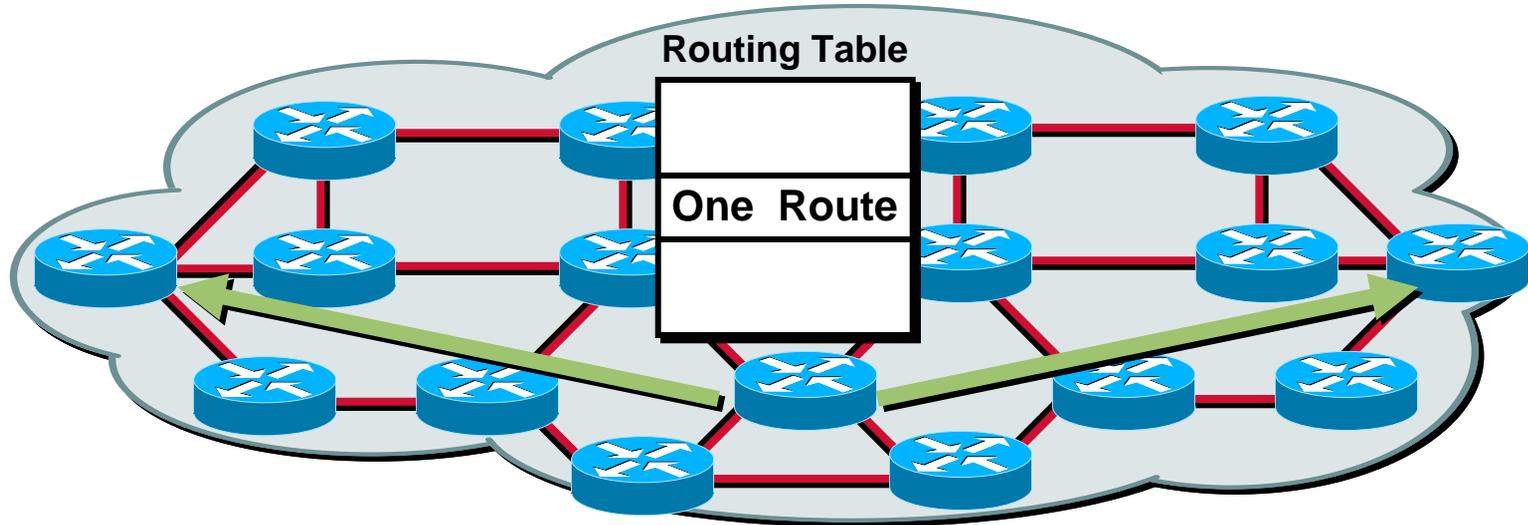

- In a distance vector environment, routing updates are propagated only to directly connected neighbors
- Pass periodic copies of full routing table to neighbor routers and accumulate distance vectors

Distance Vector—Sources of Information and Discovering Routes

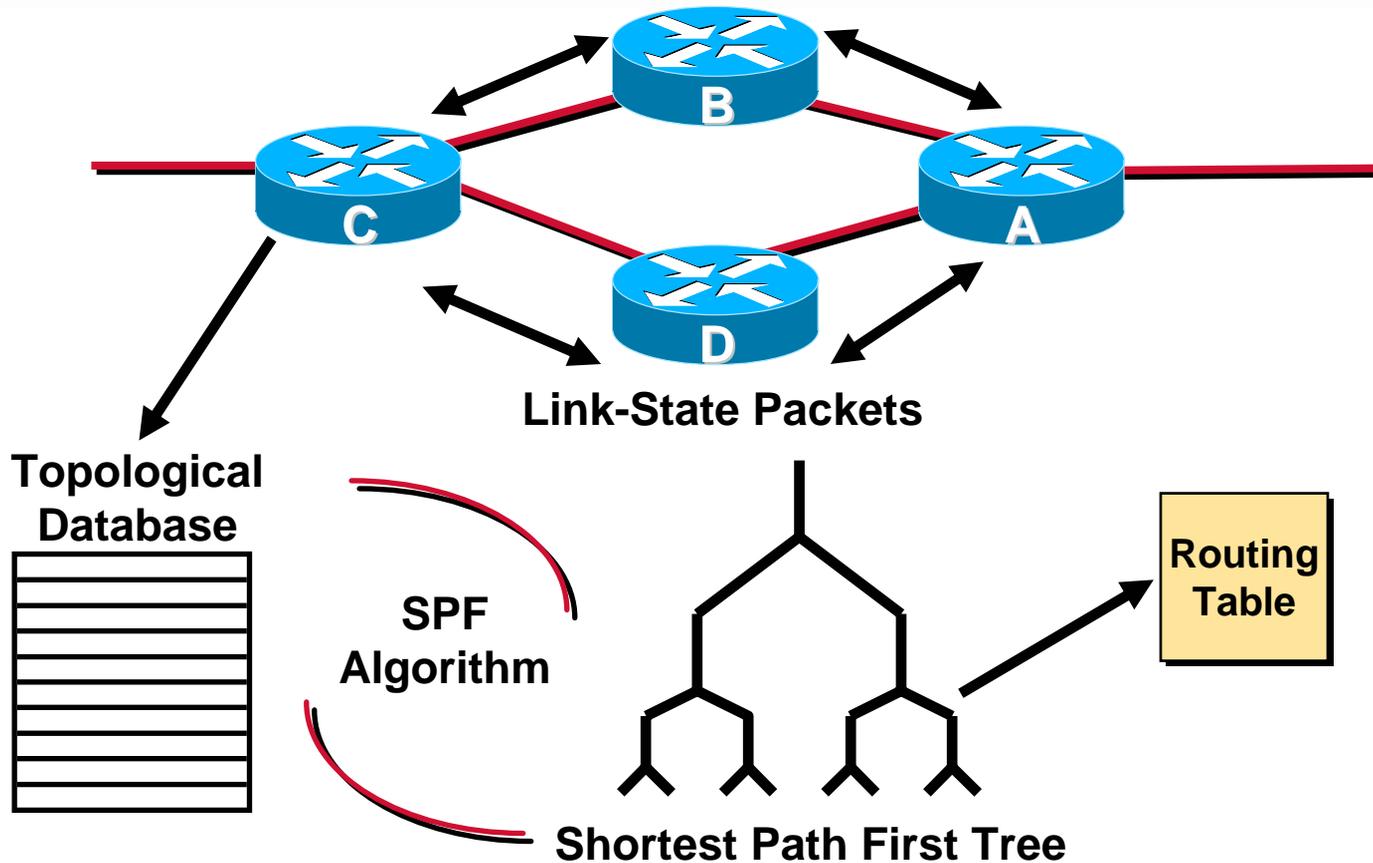

Routers discover the best path to destinations from each neighbor

Link-State Routing Update Traffic

- In a link-state environment, link-state announcements are propagated to all devices in the routing domain
 - Hierarchical design can limit the requirement to notify all devices

Link-State Routing Protocols

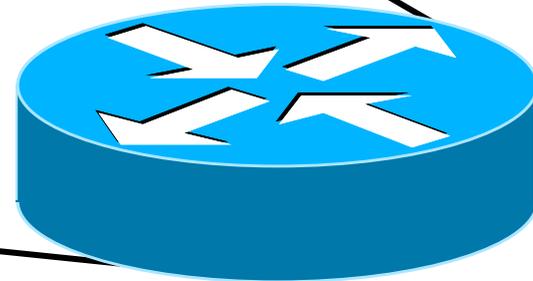

After initial flood, pass small event-triggered link-state updates to all other routers

Hybrid Routing

Choose a routing path based on distance vectors

Balanced Hybrid Routing

Converge rapidly using change-based updates

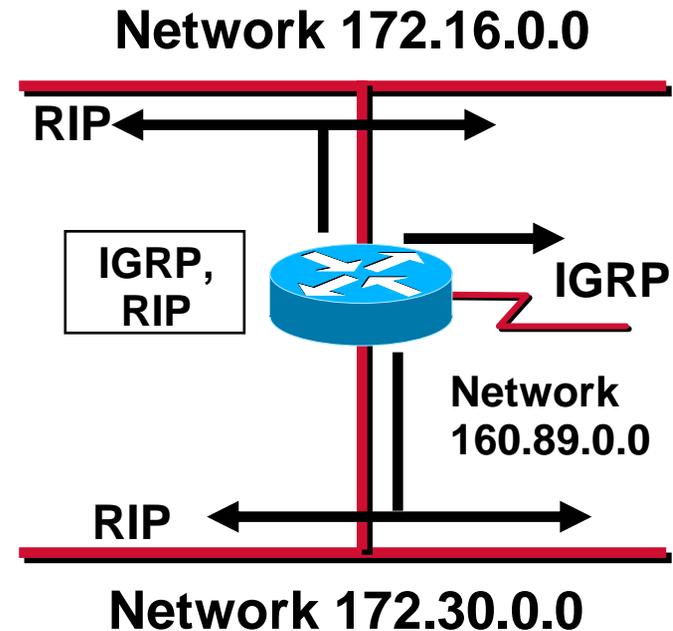

Share attributes of both distance-vector and link-state routing

IP Routing Configuration Tasks

Router configuration

- Select routing protocols
- Specify networks or interfaces

Dynamic Routing Configuration

```
Router(config)#router protocol [keyword]
```

- Defines an IP routing protocol

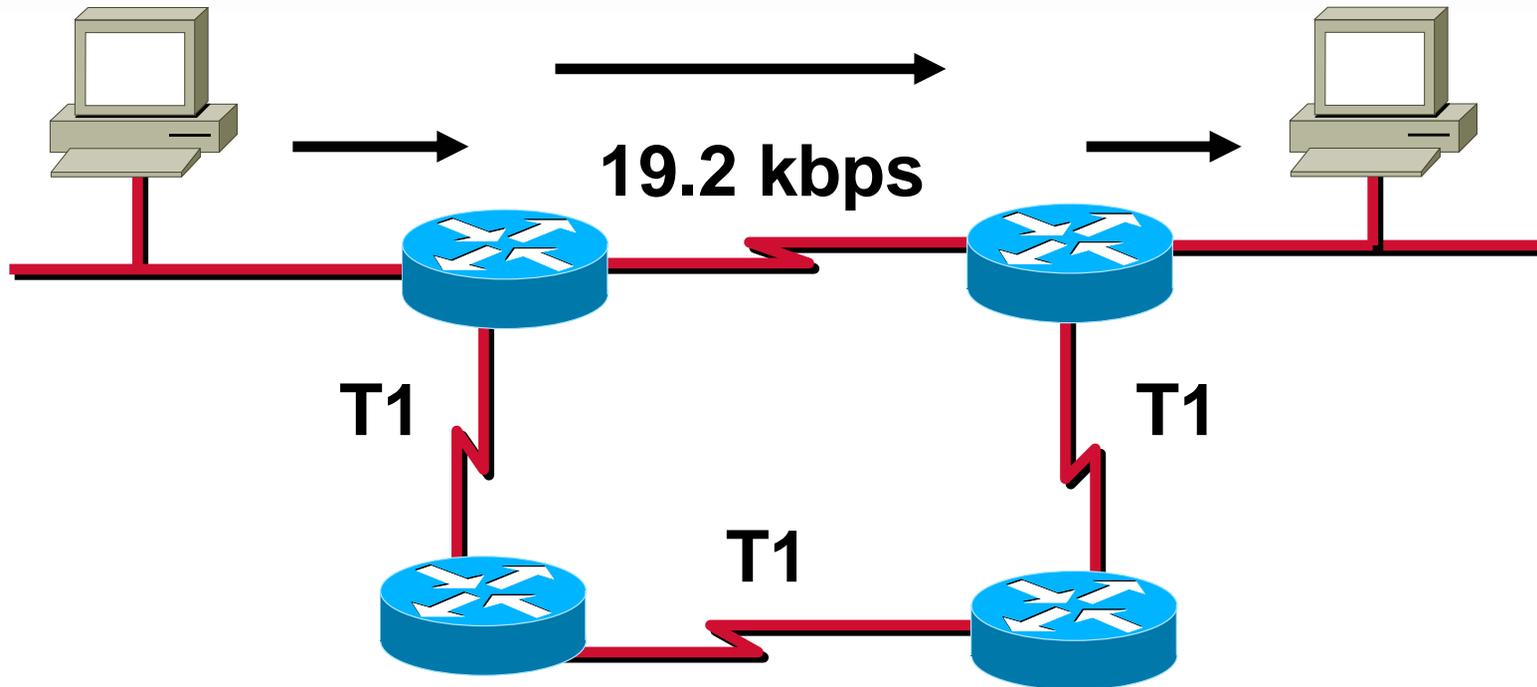

```
Router(config-router)#network network-number
```

- Mandatory configuration command for each IP routing process
- Identifies the physically connected network that routing updates are forwarded to

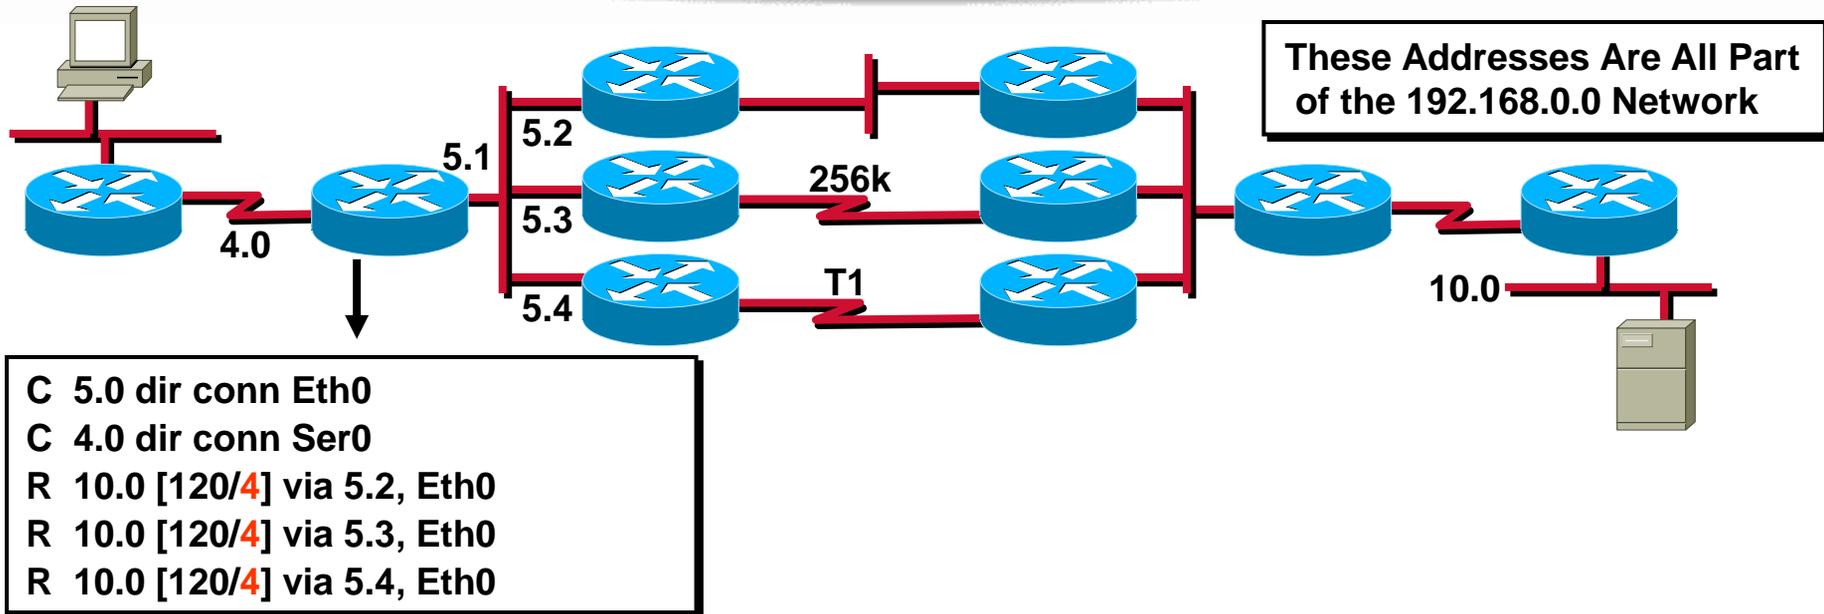

RIP Overview

RIP Overview

- Hop count metric selects the path
- Routes update every 30 seconds
- Hop count to infinity = 16

RIP Routing Metrics

- Routing metric used by RIP is hop count
 - Using a neighboring router interface is a hop
- Routing process arbitrarily selects a path from several possible equal metric paths
 - IP load balancing is enabled by default

RIP Configuration

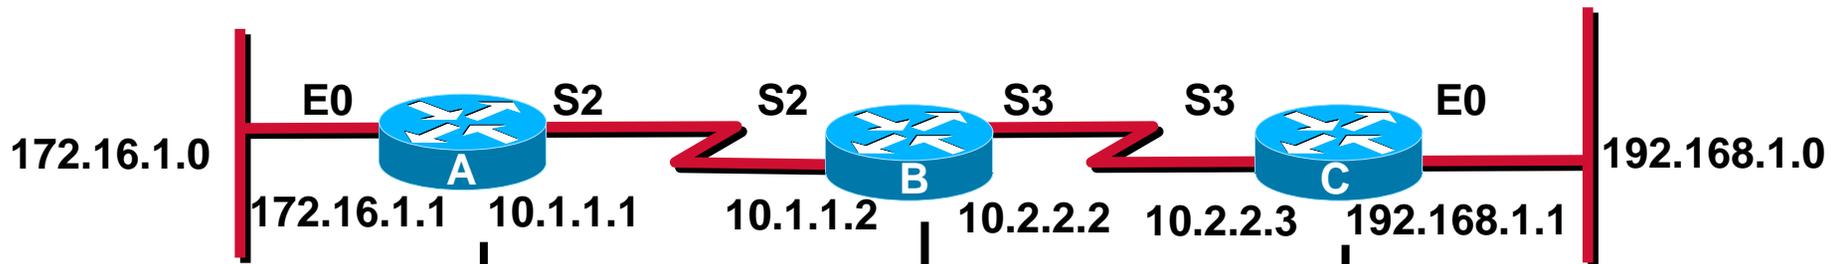

```
Router(config)#router rip
```

- Starts the RIP routing process

```
Router(config-router)#network network-number
```

- Selects participating attached networks
- The network number must be a major classful network number

RIP1/2 Configuration Example

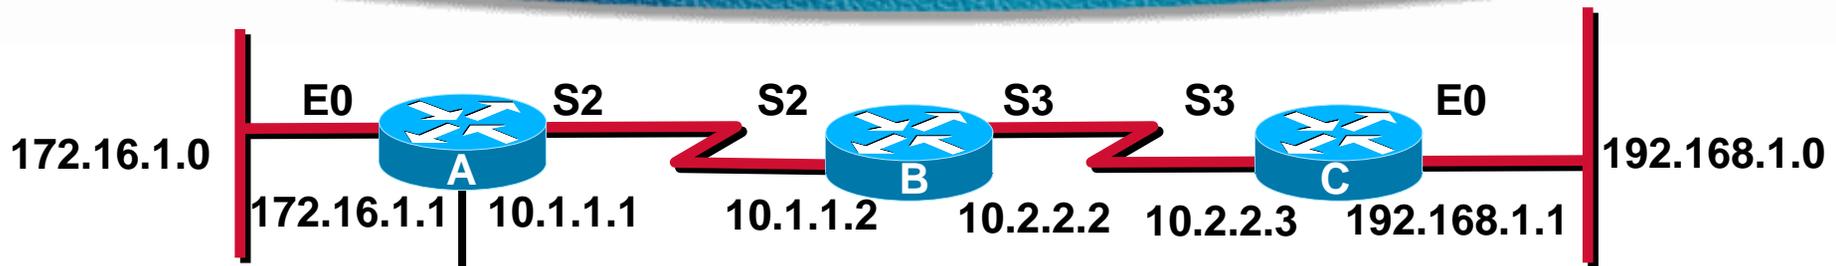

```
router rip
network 172.16.0.0
network 10.0.0.0
version 2
no auto-summary
```

```
router rip
network 192.168.1.0
network 10.0.0.0
```

```
router rip
network 10.0.0.0
```

Verifying the Routing Protocol—RIP

```
RouterA#sh ip protocols
```

```
Routing Protocol is "rip"
```

```
Sending updates every 30 seconds, next due in 0 seconds
```

```
Invalid after 180 seconds, hold down 180, flushed after 240
```

```
Outgoing update filter list for all interfaces is
```

```
Incoming update filter list for all interfaces is
```

```
Redistributing: rip
```

```
Default version control: send version 1, receive any version
```

```
Interface      Send Recv  Key-chain
```

```
Ethernet0      1      1 2
```

```
Serial2        1      1 2
```

```
Routing for Networks:
```

```
10.0.0.0
```

```
172.16.0.0
```

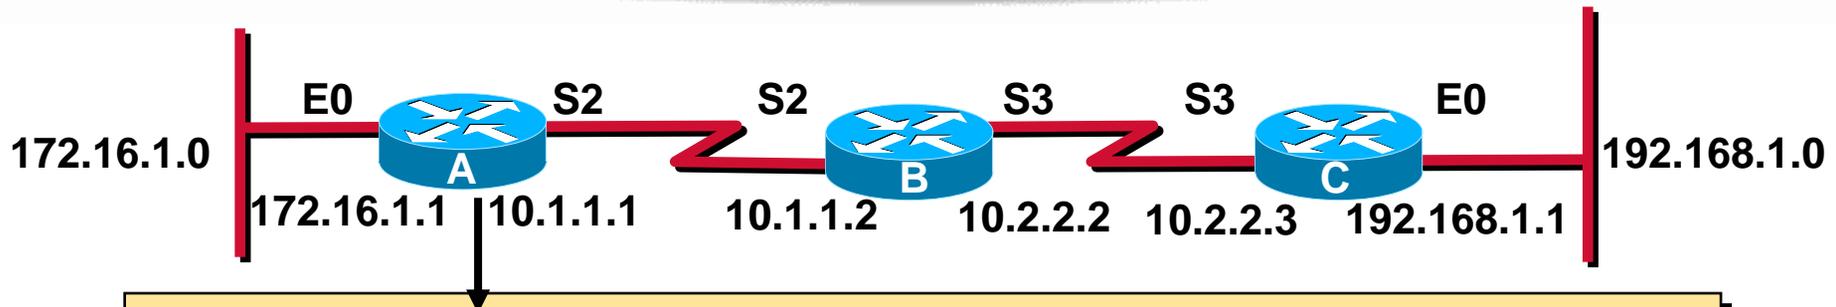

```
Routing Information Sources:
```

```
Gateway      Distance  Last Update
```

```
10.1.1.2      120      00:00:10
```

```
Distance: (default is 120)
```

Displaying the IP Routing Table

RouterA#*sh ip route*

Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, * - candidate default
U - per-user static route, o - ODR
T - traffic engineered route

Gateway of last resort is not set

172.16.0.0/24 is subnetted, 1 subnets

C 172.16.1.0 is directly connected, Ethernet0

10.0.0.0/24 is subnetted, 2 subnets

R 10.2.2.0 [120/1] via 10.1.1.2, 00:00:07, Serial2

C 10.1.1.0 is directly connected, Serial2

R 192.168.1.0/24 [120/2] via 10.1.1.2, 00:00:07, Serial2

EIGRP Overview

What Is Enhanced IGRP (EIGRP)?

- **EIGRP supports:**
 - Hybrid Routing Protocol
 - Rapid convergence
 - Reduced bandwidth usage
 - Cisco proprietary

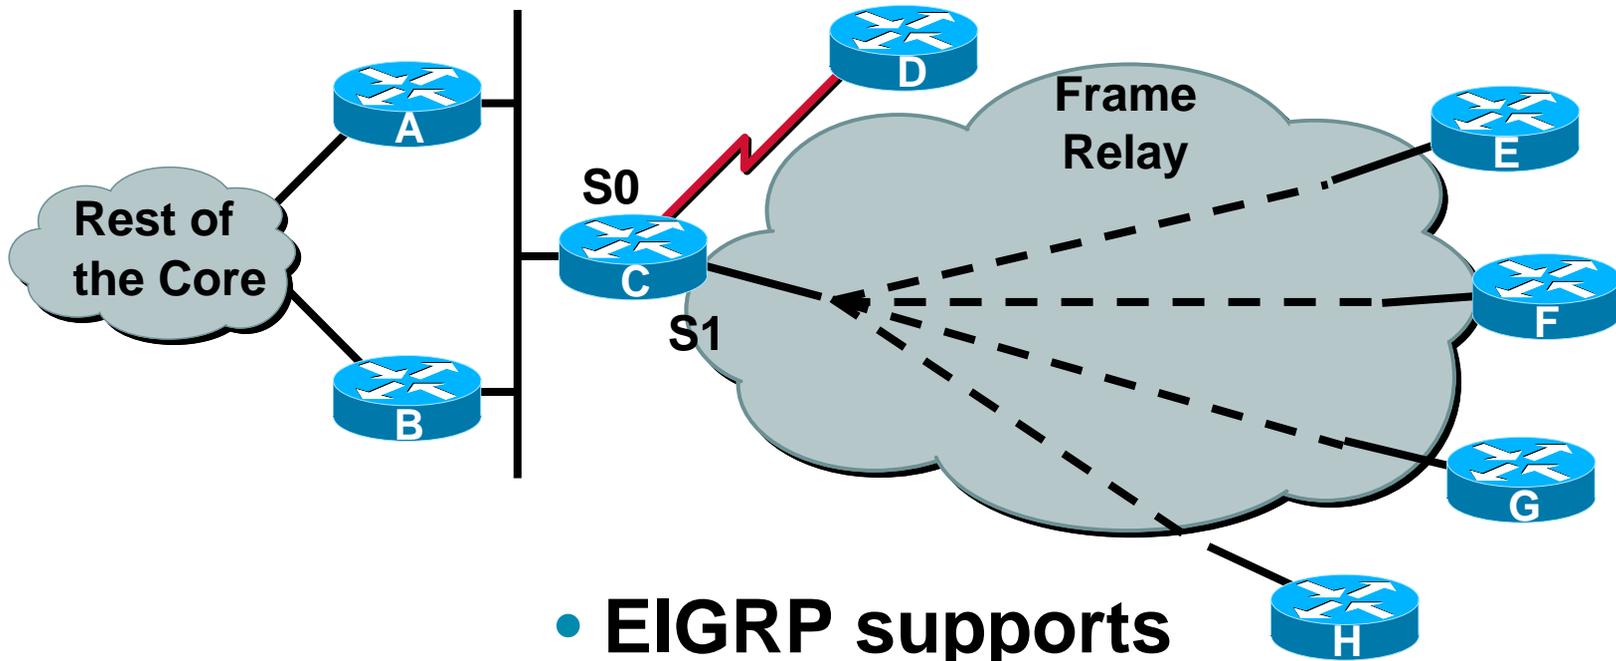

EIGRP Features

- **Advanced distance vector**
- **100% loop free**
- **Fast convergence**
- **Easy configuration**
- **Less network design constraints than OSPF**
- **Incremental updates**
- **Supports VLSM and discontinuous networks**
- **Classless routing**
- **Compatible with existing IGRP networks**

Advantages of EIGRP

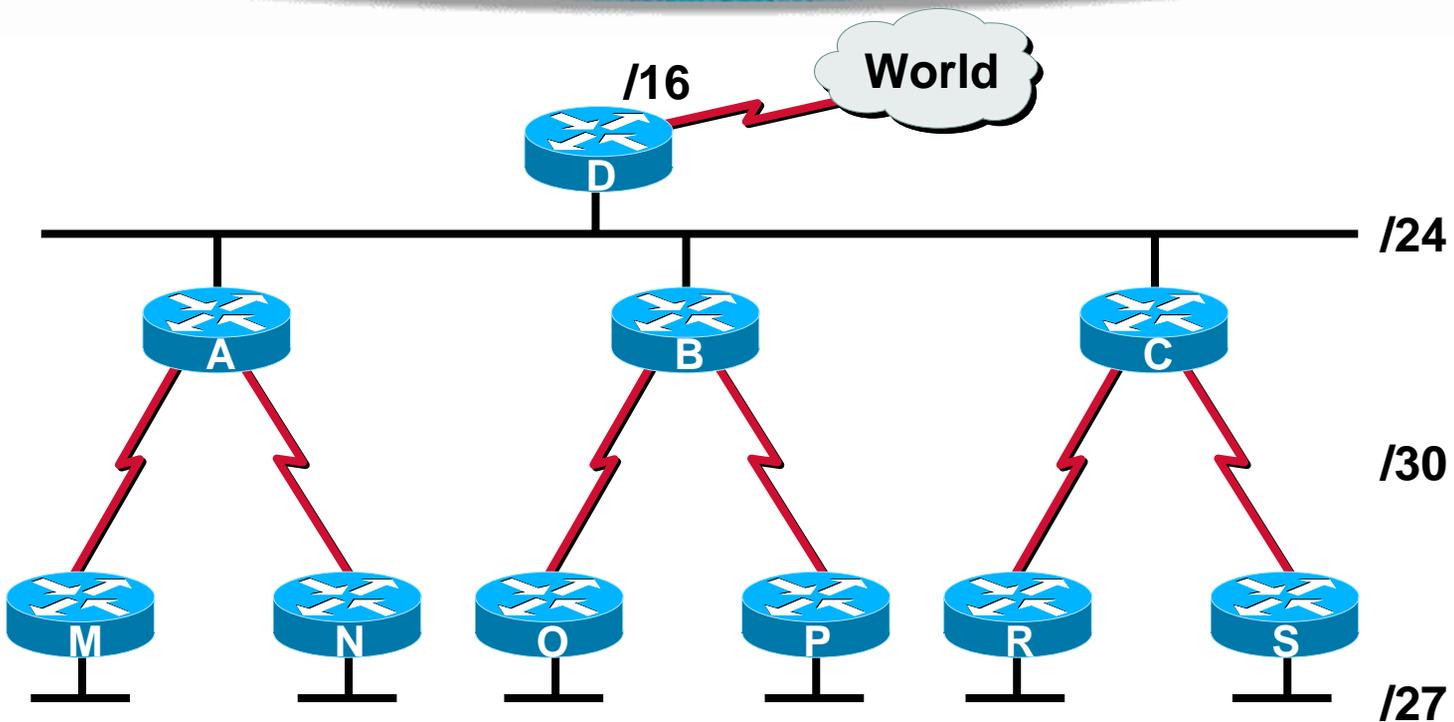

- **Uses multicast instead of broadcast**
- **Unequal cost path load balancing**
- **Easy configuration**
- **More flexible than OSPF**
 - **Manual summarization can be done in any interface at any router within the network**

EIGRP Support for Different Topologies

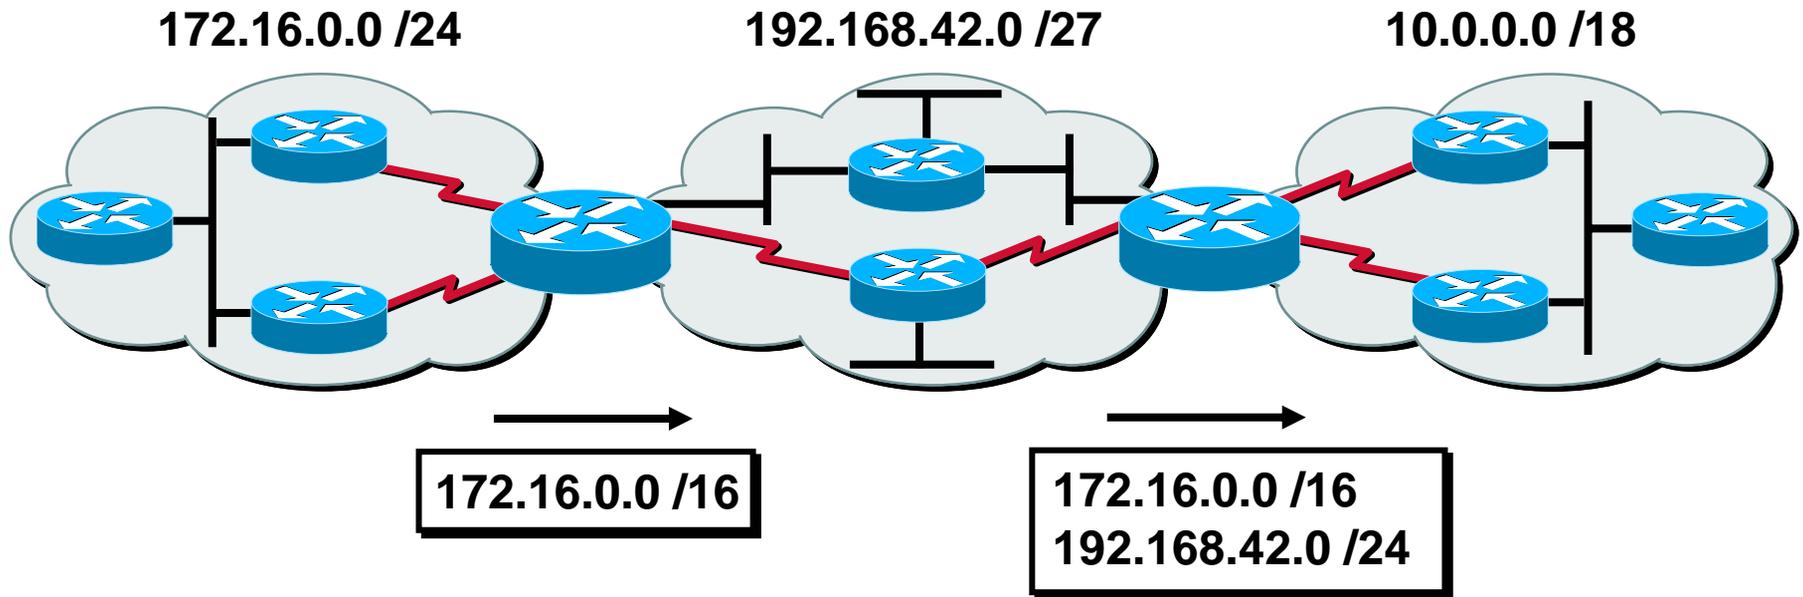

- EIGRP supports
 - Multiaccess (LANs)
 - Point-to-point (HDLC)
 - NBMA (Frame Relay)

EIGRP Support for IP Addresses

- **EIGRP supports**
 - Variable-length subnet masks (VLSMs)
 - Hierarchical designs

EIGRP Support for Route Summarization

- **EIGRP performs route summarization**
 - Classful network boundaries (default)
 - Arbitrary network boundaries (manual)

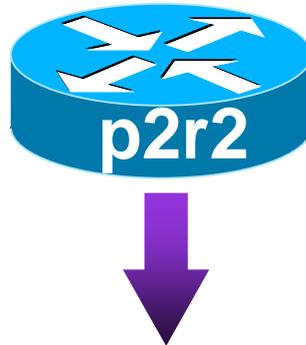

EIGRP Operations

- **Hello: Establish neighbor relationships**
- **Update: Send routing updates**
- **Query: Ask neighbors about routing information**
- **Reply: Response to query about routing information**
- **ACK: Acknowledgement of a reliable packet**

EIGRP Neighbor Relationship

- **Two routers become neighbors when they see each other's hello packet**
 - **Hello address = 224.0.0.10**
- **Hellos sent periodically (5 or 30 seconds)**
- **Neighbor declared dead when no EIGRP packets are received within hold interval**
 - **Not only hello can reset the hold timer**
- **Hold time by default is three times the hello time**

What Is in a Neighbor Table?

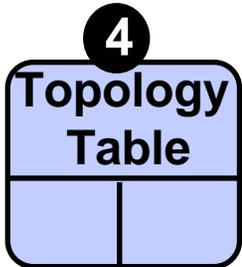

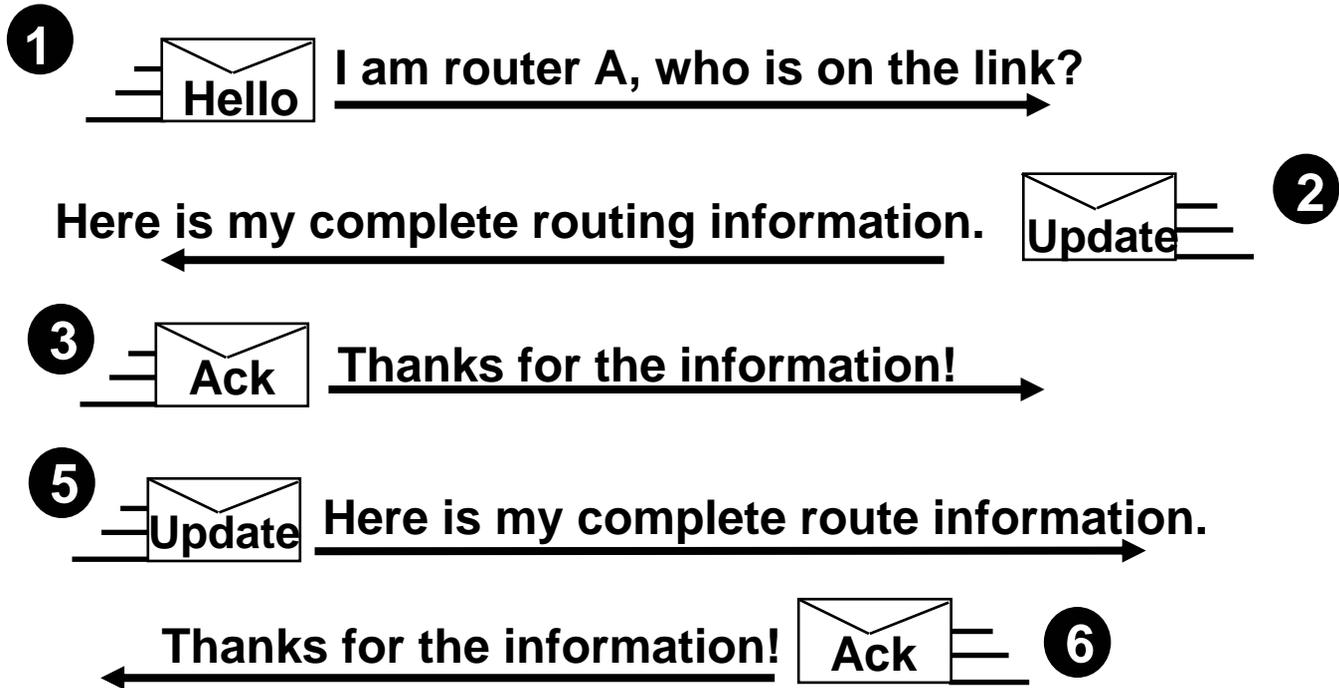

```
p2r2#show ip eigrp neighbors
```

```
IP-EIGRP neighbors for process 400
```

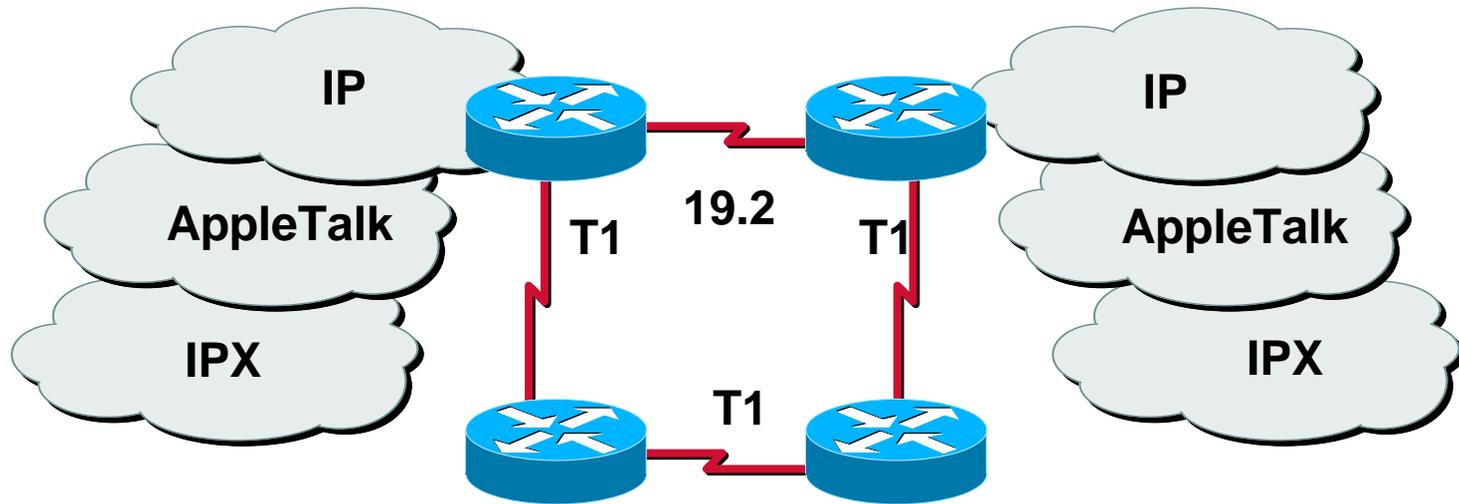

H	Address	Interface	Hold	Uptime	SRTT	RTO	Q	Seq
			(sec)		(ms)		Cnt	Num
1	172.68.2.2	To0	13	02:15:30	8	200	0	9
0	172.68.16.2	Se1	10	02:38:29	29	200	0	6

Initial Route Discovery

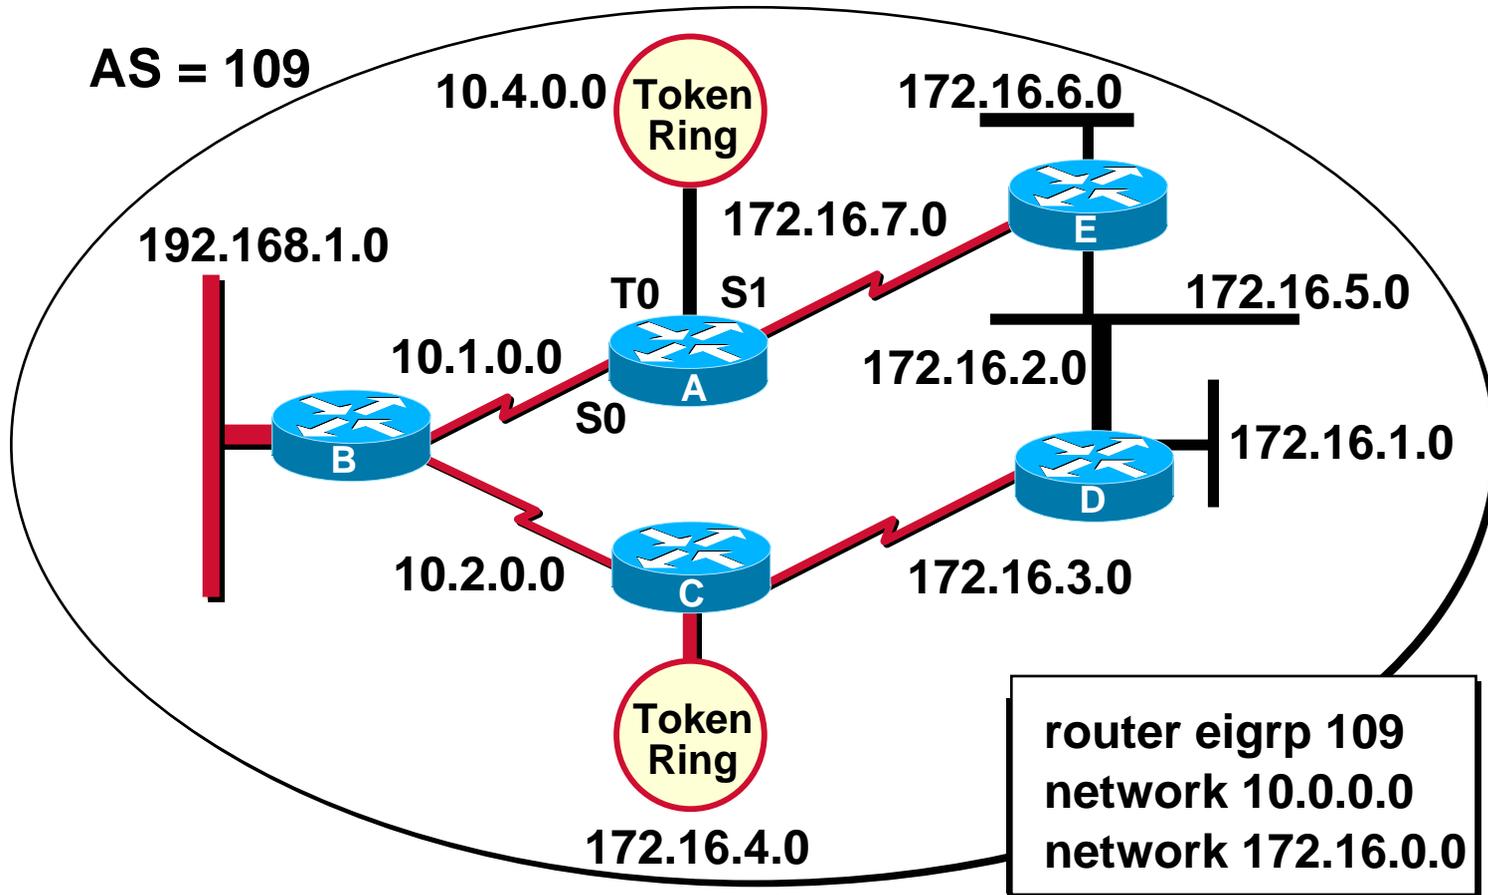

Converged !

EIGRP Route Selection

- **EIGRP uses a composite metric to pick the best path**

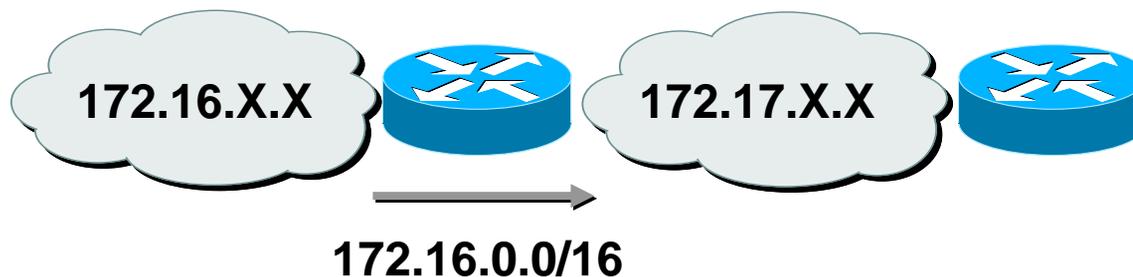

Configuring EIGRP

- Network 192.168.0.0 is not configured on Router A because it is not directly connected to Router A

EIGRP Summarization—Automatic

- **Purpose: Smaller routing tables, smaller updates, query boundary**
- **Autosummarization:**
 - On major network boundaries, subnetworks are summarized to a single classful (major) network
 - Autosummarization is turned on by default

EIGRP Summarization—Manual

- **Manual summarization**
 - **Configurable on a per-interface basis in any router within network**
 - **When summarization is configured on an interface, the router immediately creates a route pointing to null zero**
 - **Loop prevention mechanism**
 - **When the last specific route of the summary goes away, the summary is deleted**
 - **The minimum metric of the specific routes is used as the metric of the summary route**

Configuring Summarization

(config-router)#

```
no auto-summary
```

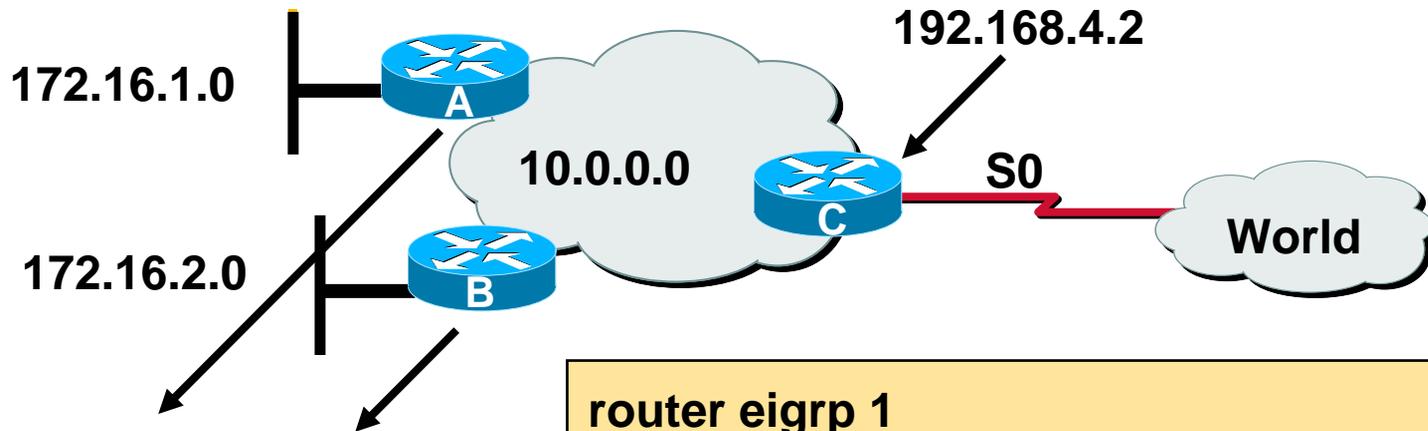

- Turns off autosummarization for the EIGRP process

(config-if)#

```
ip summary-address eigrp <as-number>  
  <address> <mask>
```

- Creates a summary address to be generated by this interface

Summarizing EIGRP Routes

```
router eigrp 1
network 10.0.0.0
network 172.16.0.0
no auto-summary
```

```
router eigrp 1
network 10.0.0.0
network 192.168.4.0
!
int s0
ip address 192.168.4.2 255.255.255.0
ip summary-address eigrp 1
172.16.0.0 255.255.0.0
```

Verifying EIGRP Operation

Router#

```
show ip eigrp neighbors
```

Router#

```
show ip eigrp topology
```

Router#

```
show ip route eigrp
```

Router#

```
show ip protocols
```

Router#

```
show ip eigrp traffic
```

- Displays the neighbors discovered by IP EIGRP
- Displays the IP EIGRP topology table
- Displays current EIGRP entries in the routing table
- Displays the parameters and current state of the active routing protocol process
- Displays the number of IP EIGRP packets sent and received

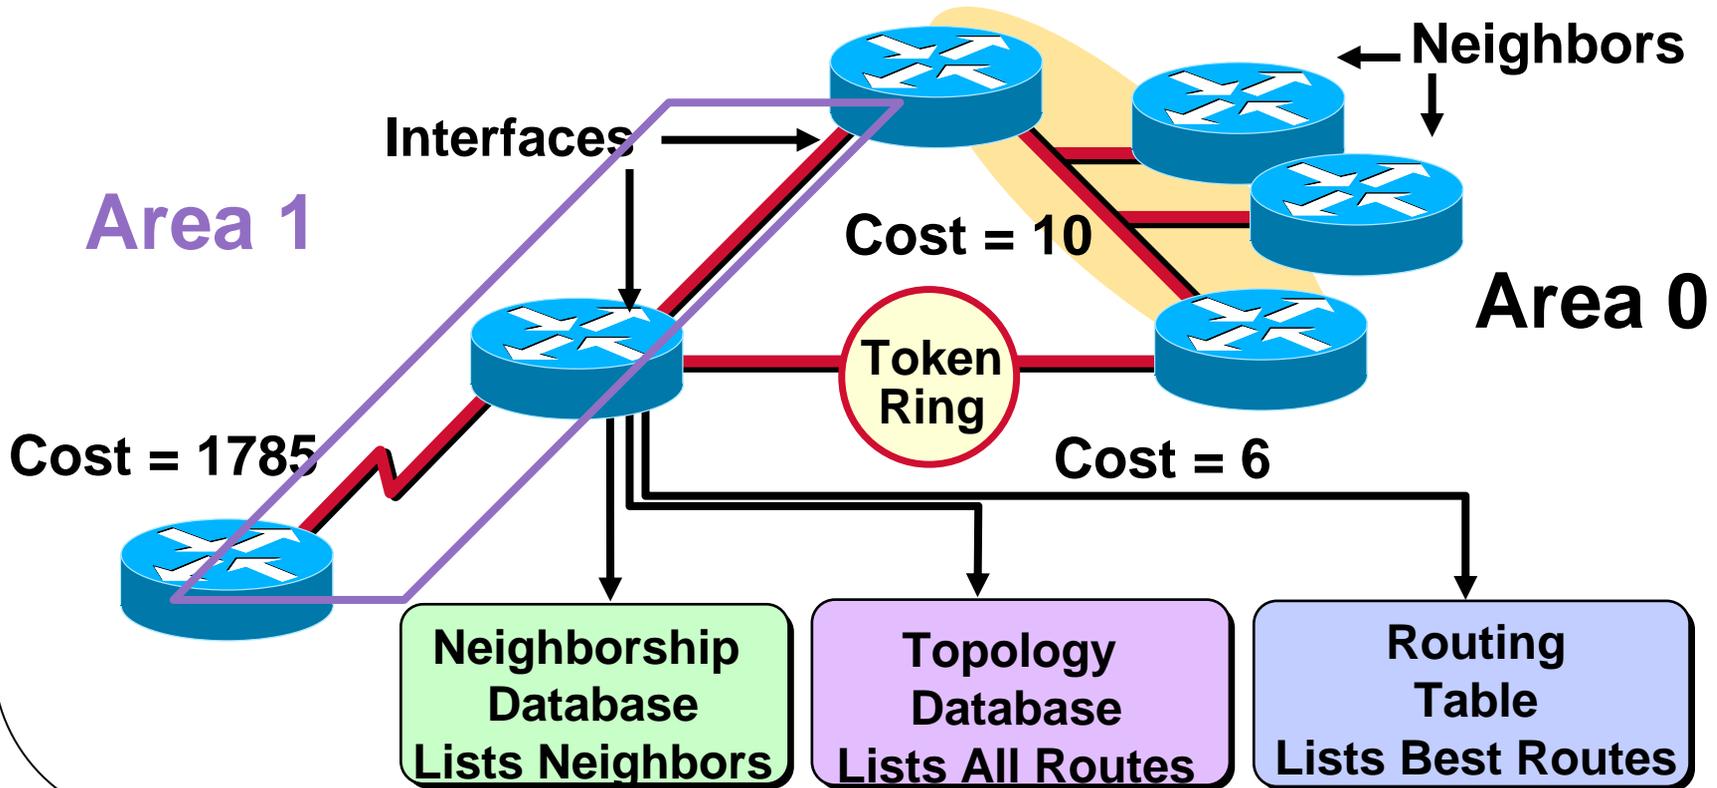

OSPF Overview

What Is OSPF?

- **Open Shortest Path First**
- **Has fast convergence**
- **Hierarchical Routing**
- **Supports VLSM**
- **Processes updates efficiently**
- **Selects paths based on bandwidth**
- **Supports equal-cost multipath**

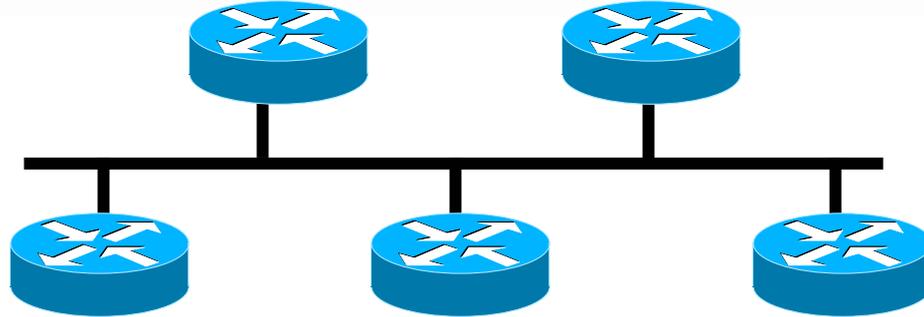

OSPF Terminology

Autonomous System

OSPF Topologies

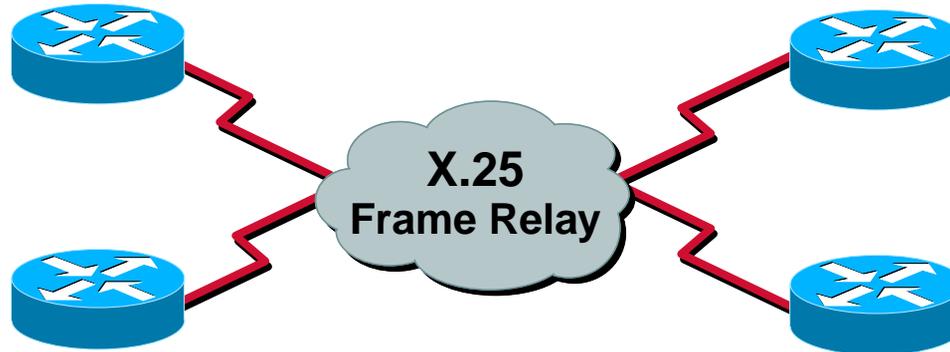

**Broadcast
Multiaccess**

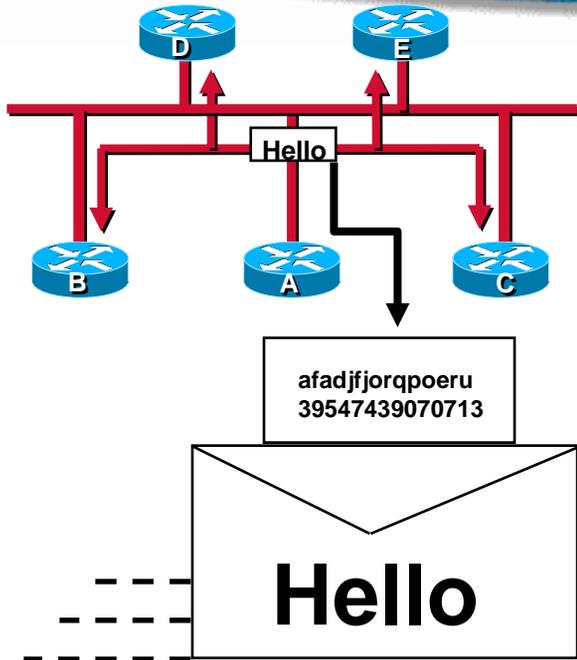

Point-to-Point

NBMA

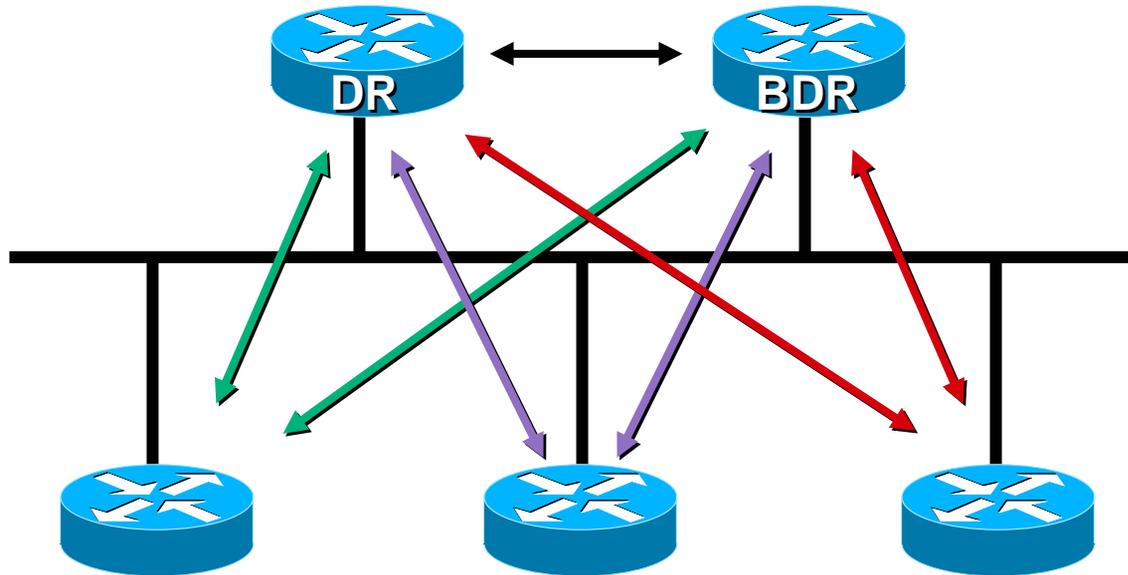

Neighborhood

Router ID
Hello/dead intervals *
Neighbors
Area-ID *
Router priority
DR IP address
BDR IP address
Authentication password*
Stub area flag *

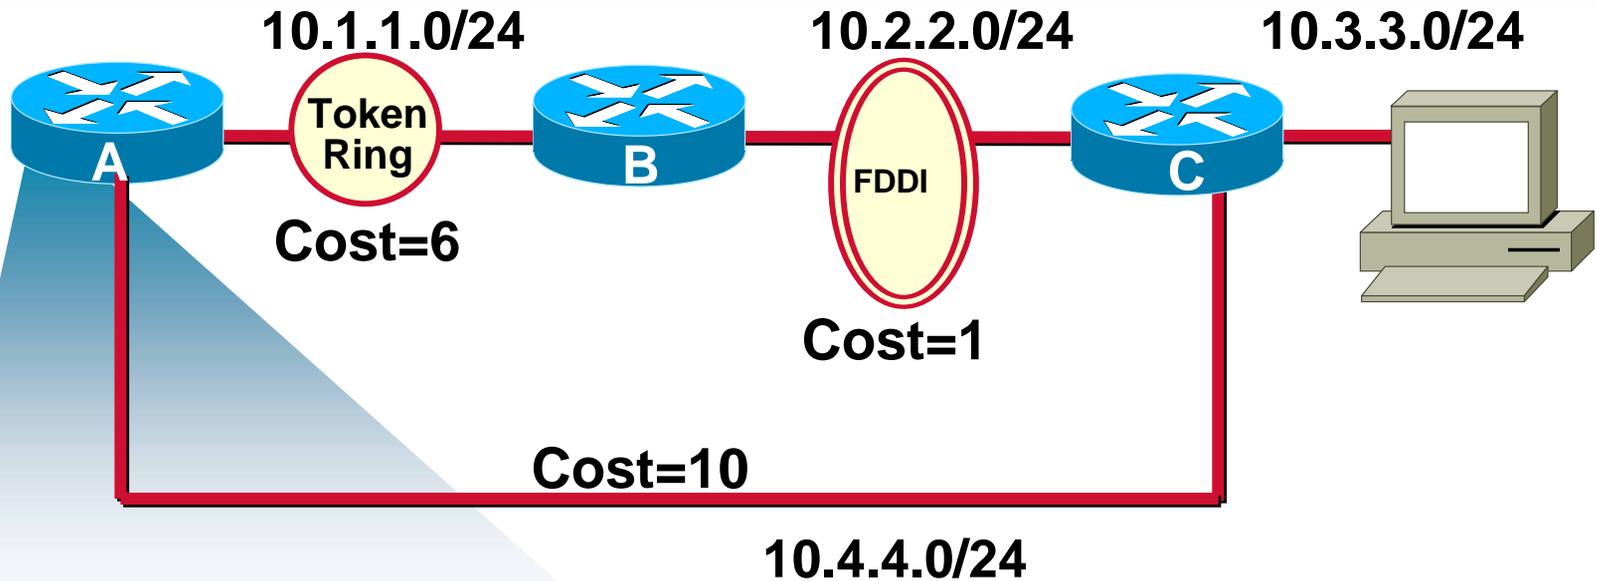

* Entry must match on neighboring routers

DR and BDR

- Hellos elect DR and BDR to represent segment
- Each router then forms adjacency with DR and BDR

Choosing Routes

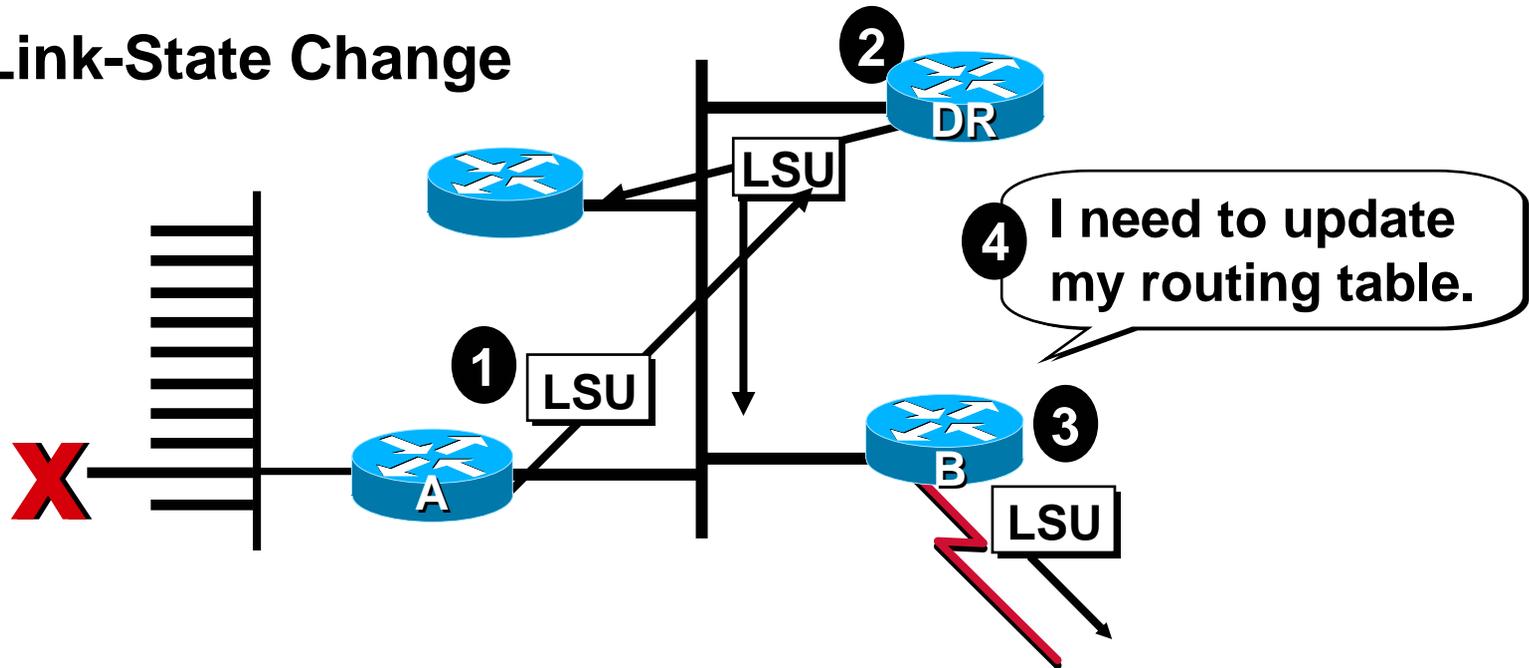

Topology Table

Net	Cost	Out Interface
10.2.2.0	6	To0
10.3.3.0	7	To0
10.3.3.0	10	E0

This is the best route to 10.3.3.0.

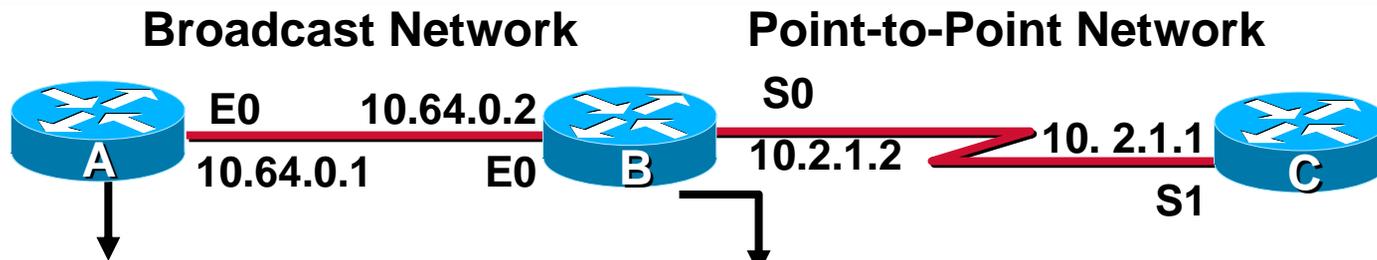

Maintaining Routing Information

Link-State Change

- Router A tells all OSPF DRs on 224.0.0.6
- DR tells others on 224.0.0.5

Configuring OSPF on Internal Routers

```
<Output Omitted>
interface Ethernet0
 ip address 10.64.0.1 255.255.255.0
!
<Output Omitted>
router ospf 1
network 10.0.0.0 0.255.255.255 area 0
```

```
<Output Omitted>
interface Ethernet0
 ip address 10.64.0.2 255.255.255.0
!
interface Serial0
 ip address 10.2.1.2 255.255.255.0
<Output Omitted>
router ospf 50
network 10.2.1.2 0.0.0.0 area 0
network 10.64.0.2 0.0.0.0 area 0
```

Can Assign Network or
Interface Address.

Configuring Optional Commands

Unadvertised Loopback Address

Ex: 192.168.255.254

- Not in OSPF table
- Saves address space
- Cannot use ping

Advertised Loopback Address

Ex: 172.16.17.5

- In OSPF table
- Uses address space
- Can use ping

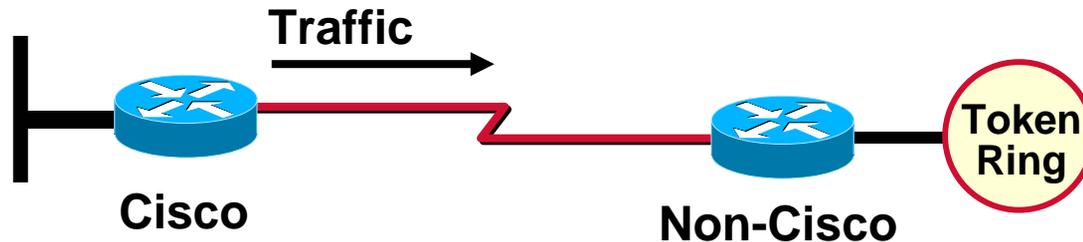

Network
172.16.0.0

Router ID:

- Number by which the router is known to OSPF
- Default: The highest IP address on an active interface at the moment of OSPF process startup
- Can be overridden by a loopback interface: Highest IP address of any active loopback interface

Configuring Optional Commands (cont.)

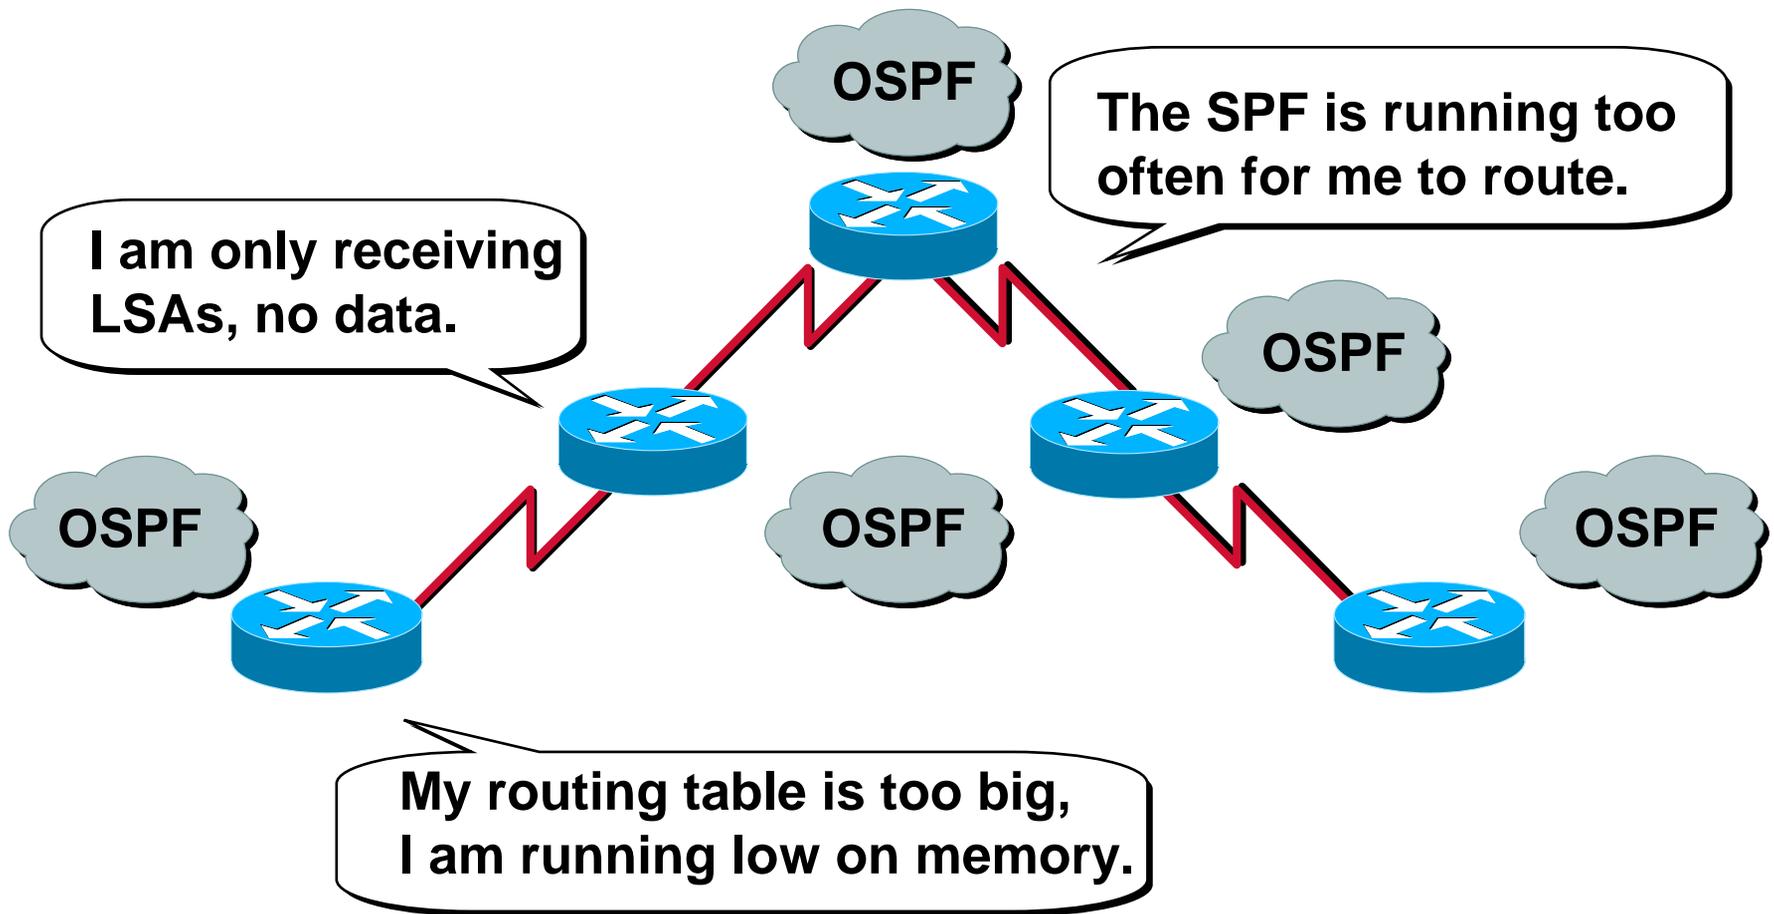

Router(config-if)#

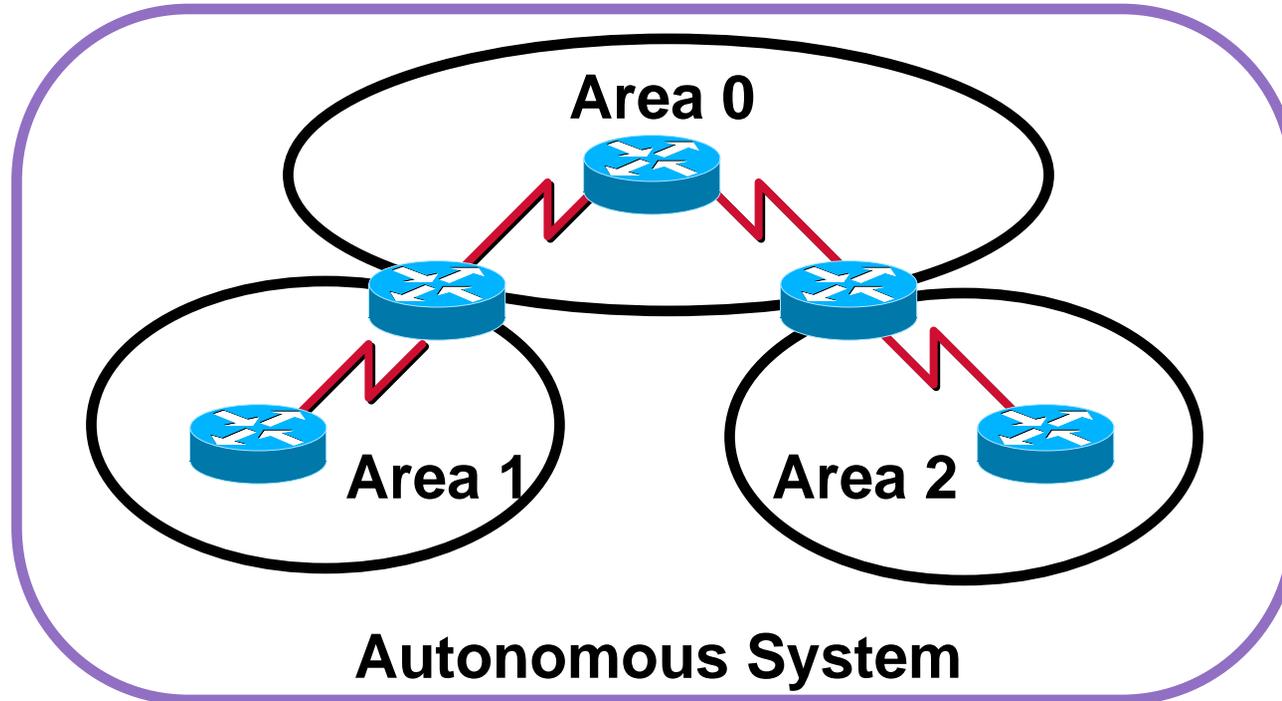

```
ip ospf cost cost
```

- Assigns a cost to an outgoing interface
- May be required for interoperability
- Use default cost between Cisco devices

Issues with Maintaining a Large OSPF Network

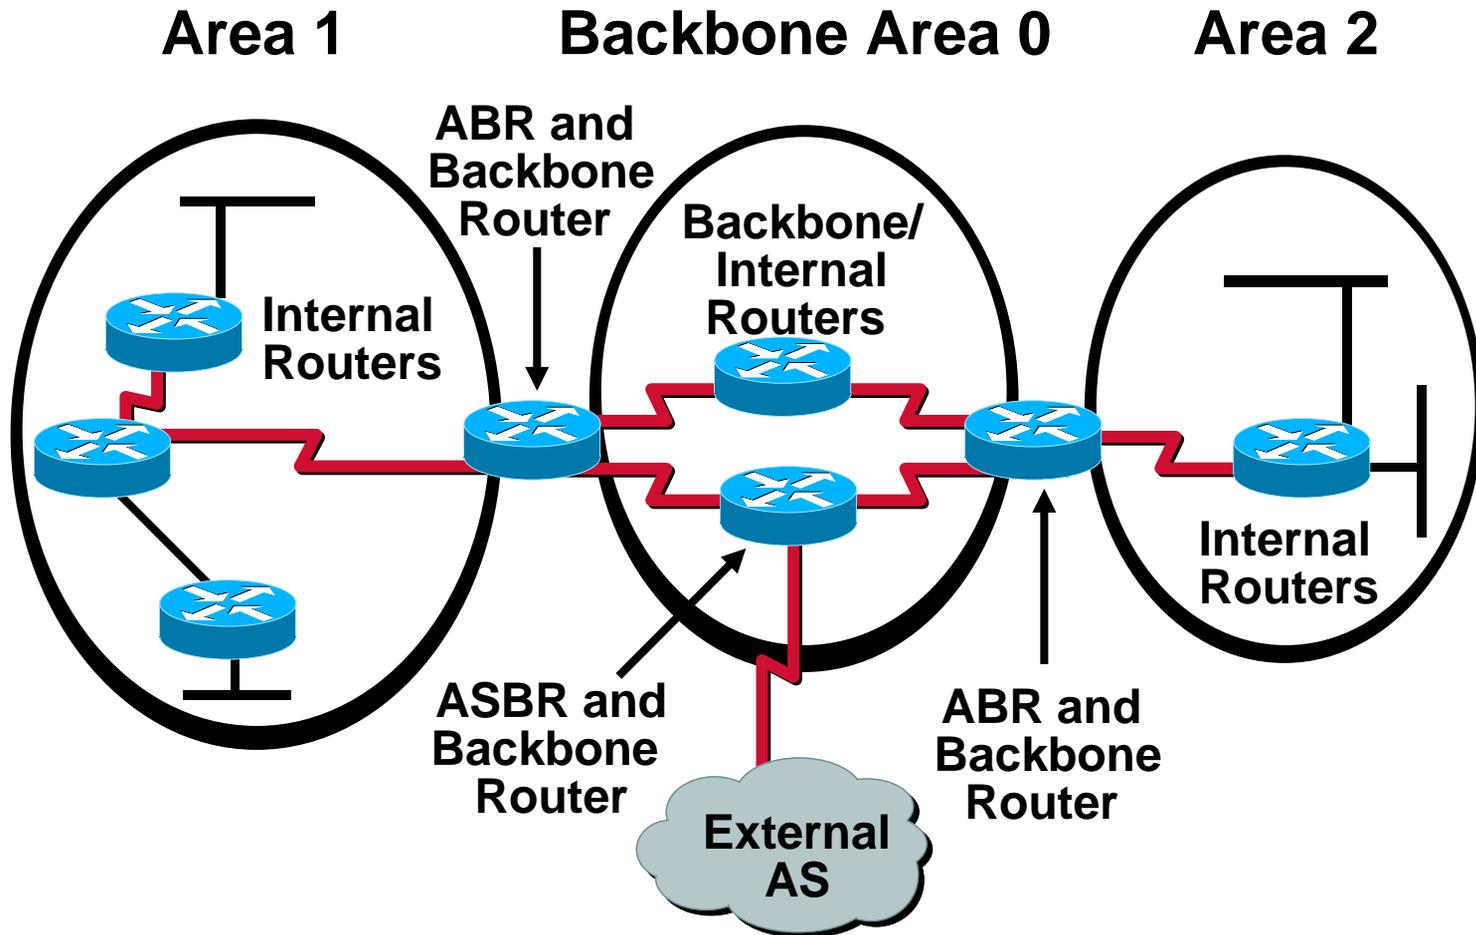

OSPF Hierarchical Routing

- **Consists of areas and autonomous systems**
- **Minimizes routing update traffic**

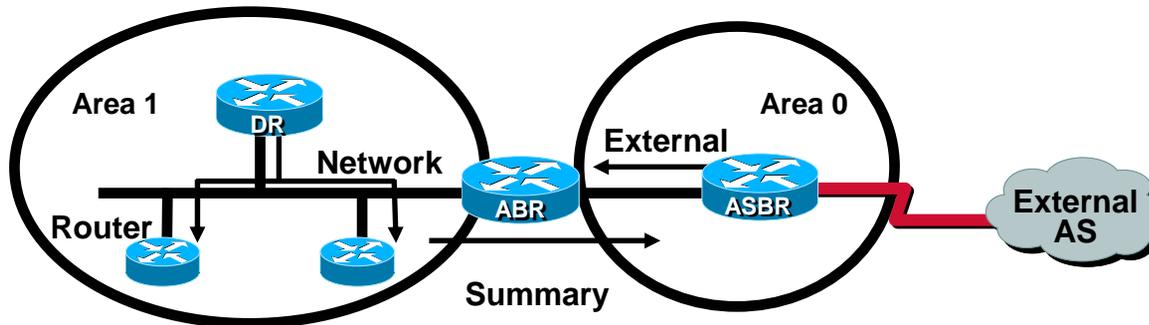

Types of OSPF Routers

Types of Link-State Advertisements

- **Type 1: Router link entry**
- **Type 2: Network link entry**
- **Type 3 and 4: Summary link entry**
- **Type 5: AS external link entry**

LSAs in OSPF Database

p1r3#*show ip ospf database*

OSPF Router with ID (10.64.0.1) (Process ID 1)

Router Link States (Area 1)

Link ID	ADV Router	Age	Seq#	Checksum	Link count
10.1.2.1	10.1.2.1	651	0x80000005	0xD482	4

Net Link States (Area 1)

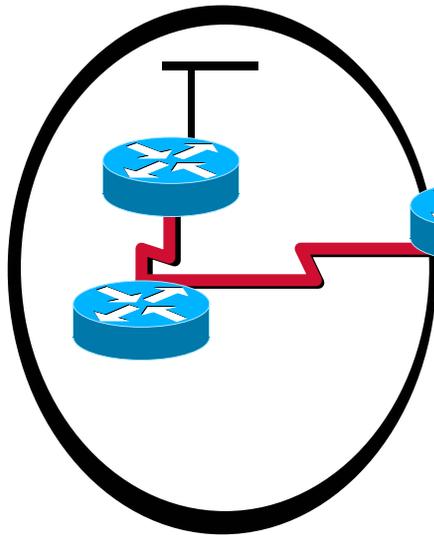

Link ID	ADV Router	Age	Seq#	Checksum
10.64.0.1	10.64.0.1	538	0x80000002	0xAD9A

Summary Net Link States (Area 1)

Link ID	ADV Router	Age	Seq#	Checksum
10.2.1.0	10.2.1.2	439	0x80000002	0xE6F8

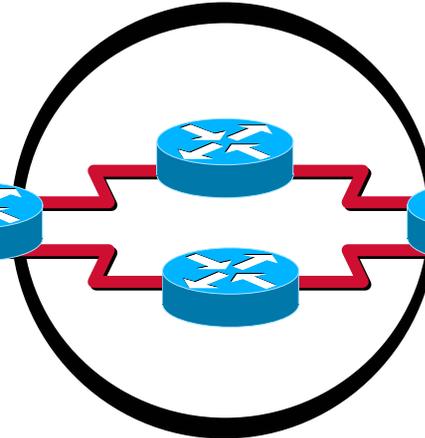

Types of Areas

Stub Area

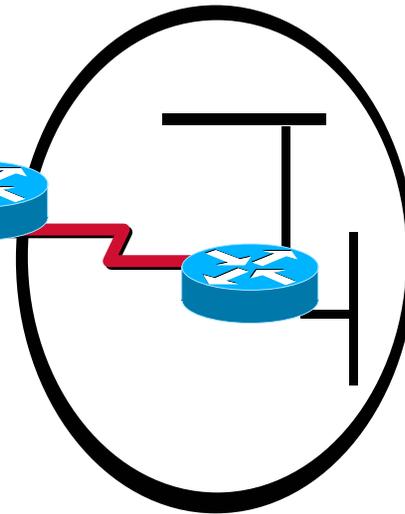

Does not accept external LSAs.

Backbone Area 0

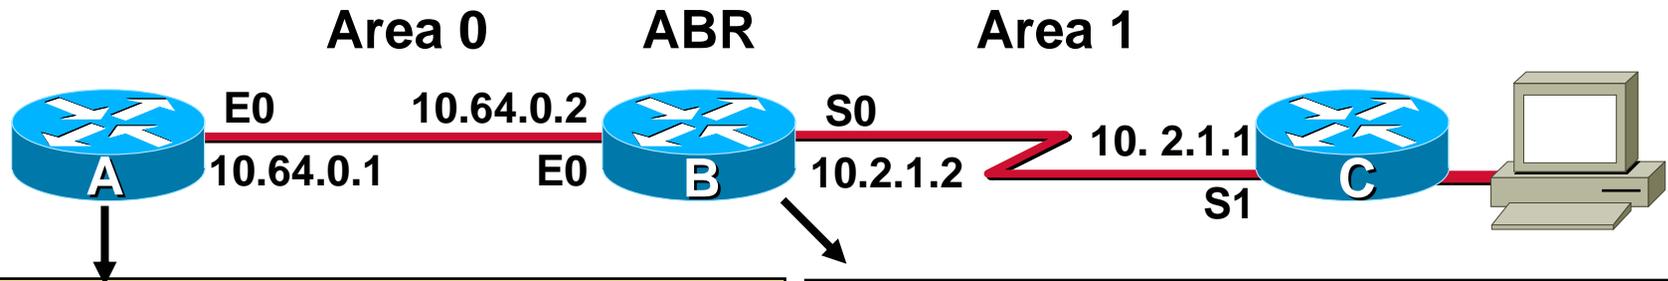

Interconnects areas; accepts all LSAs.

Totally Stubby Area

Does not accept external or summary LSAs.

Configuring OSPF ABRs

```
<Output Omitted>
interface Ethernet0
 ip address 10.64.0.1 255.255.255.0
!
<Output Omitted>
router ospf 77
network 10.0.0.0 0.255.255.255 area 0
```

```
<Output Omitted>
interface Ethernet0
 ip address 10.64.0.2 255.255.255.0
!
interface Serial0
 ip address 10.2.1.2 255.255.255.0
<Output Omitted>
router ospf 50
network 10.2.1.2 0.0.0.0 area 1
network 10.64.0.2 0.0.0.0 area 0
```

Configuring Route Summarization

Router(config-router)#

```
area area-id range address mask
```

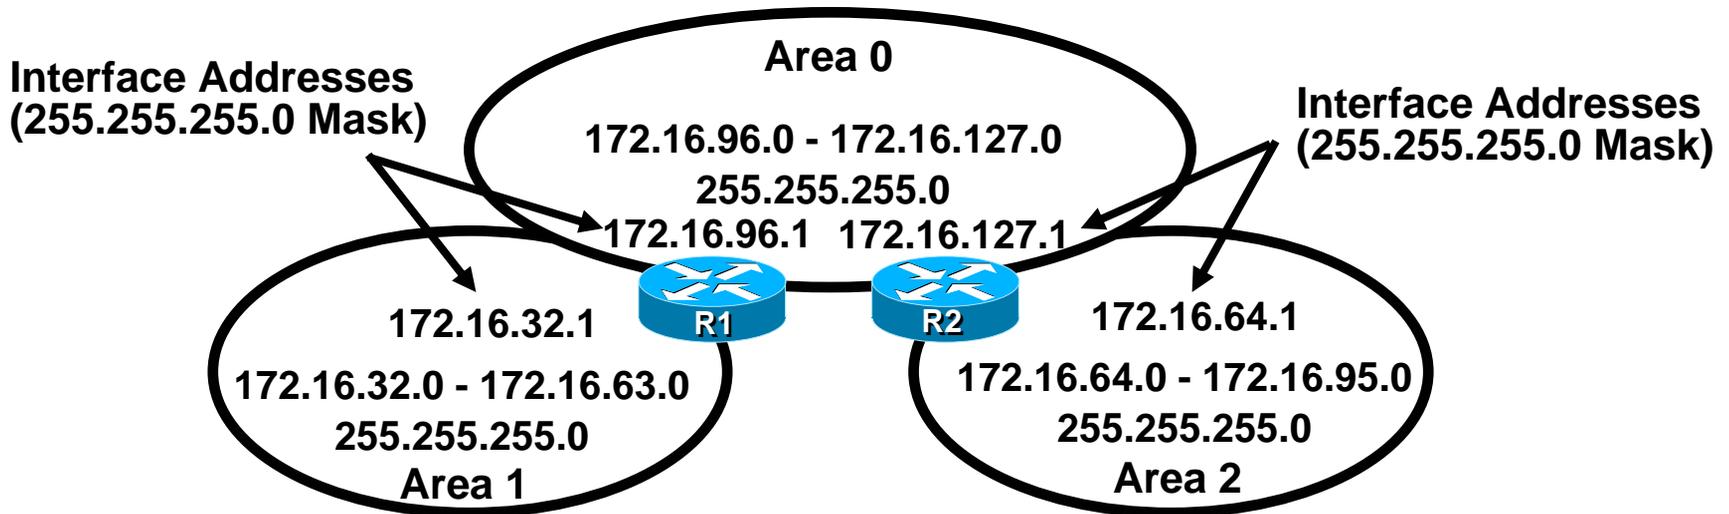

- Consolidates intra-area (IA) routes on an ABR

Router(config-router)#

```
summary-address address mask [not-advertise] [tag tag]
```

- Consolidates external routes on an ASBR

Route Summarization Configuration Example

```
R1#  
router ospf 100  
network 172.16.32.1 0.0.0.0 area 1  
network 172.16.96.1 0.0.0.0 area 0  
area 0 range 172.16.96.0 255.255.224.0  
area 1 range 172.16.32.0 255.255.224.0
```

```
R2#  
router ospf 100  
network 172.16.64.1 0.0.0.0 area 2  
network 172.16.127.1 0.0.0.0 area 0  
area 0 range 172.16.96.0 255.255.224.0  
area 2 range 172.16.64.0 255.255.224.0
```

Verifying OSPF Operation

Router#

```
show ip protocols
```

- **Verifies that OSPF is configured**

Router#

```
show ip route
```

- **Displays all the routes learned by the router**

Router#

```
show ip ospf interface
```

- **Displays area ID and adjacency information**

Verifying OSPF Operation (cont.)

Router#

```
show ip ospf
```

- **Displays OSPF timers and statistics**

Router#

```
show ip ospf neighbor detail
```

- **Displays information about DR, BDR and neighbors**

Router#

```
show ip ospf database
```

- **Displays the link-state database**

Verifying OSPF Operation (cont.)

Router#

```
clear ip route *
```

- **Allows you to clear the IP routing table (for all routing protocol)**

show ip ospf interface

R2#*sh ip ospf int e0*

Ethernet0 is up, line protocol is up

Internet Address 192.168.0.12/24, Area 0

Process ID 1, Router ID 192.168.0.12, Network Type BROADCAST, Cost: 10

Transmit Delay is 1 sec, State DROTHER, Priority 1

Designated Router (ID) 192.168.0.11, Interface address 192.168.0.11

Backup Designated router (ID) 192.168.0.13, Interface address 192.168.0.13

Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5

Hello due in 00:00:04

Neighbor Count is 3, Adjacent neighbor count is 2

Adjacent with neighbor 192.168.0.13 (Backup Designated Router)

Adjacent with neighbor 192.168.0.11 (Designated Router)

Suppress hello for 0 neighbor(s)

show ip ospf database

R2#show ip ospf database

OSPF Router with ID (192.168.0.12) (Process ID 1)

Router Link States (Area 0)

Link ID	ADV Router	Age	Seq#	Checksum	Link count
192.168.0.10	192.168.0.10	817	0x80000003	0xFF56	1
192.168.0.11	192.168.0.11	817	0x80000003	0xFD55	1
192.168.0.12	192.168.0.12	816	0x80000003	0xFB54	1
192.168.0.13	192.168.0.13	816	0x80000003	0xF953	1

show ip route ospf

R2#*sh ip route ospf*

163.24.0.0/16 is variably subnetted, 16 subnets, 3 masks

O E2 163.24.0.0/16 [110/20] via 163.24.165.254, 1w5d, Vlan1

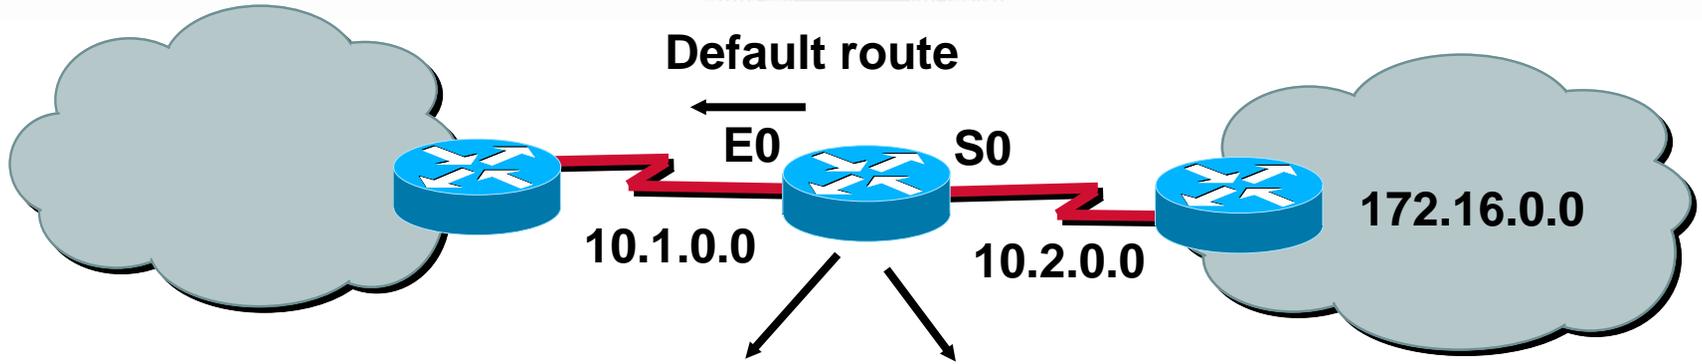

10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks

O E2 10.163.96.0/19 [110/20] via 163.24.165.254, 1w5d, Vlan1

O E2 210.60.38.0/24 [110/20] via 163.24.165.254, 1w5d, Vlan1

O E2 203.71.77.0/24 [110/20] via 163.24.165.254, 1w5d, Vlan1

ip classless Command

```
Router(config)#ip classless
```

To get to 10.7.1.1:

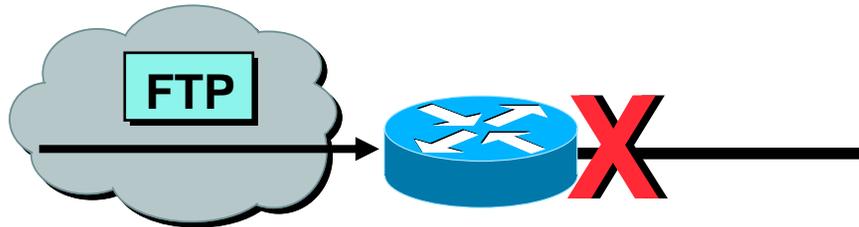

- With *ip classless* → Default
- With *no ip classless* → Drop

Network Protocol	Destination Network	Exit Interface
C	10.1.0.0	E0
C	10.2.0.0	S0
RIP	172.16.0.0 via 0.0.0.0	S0 E0

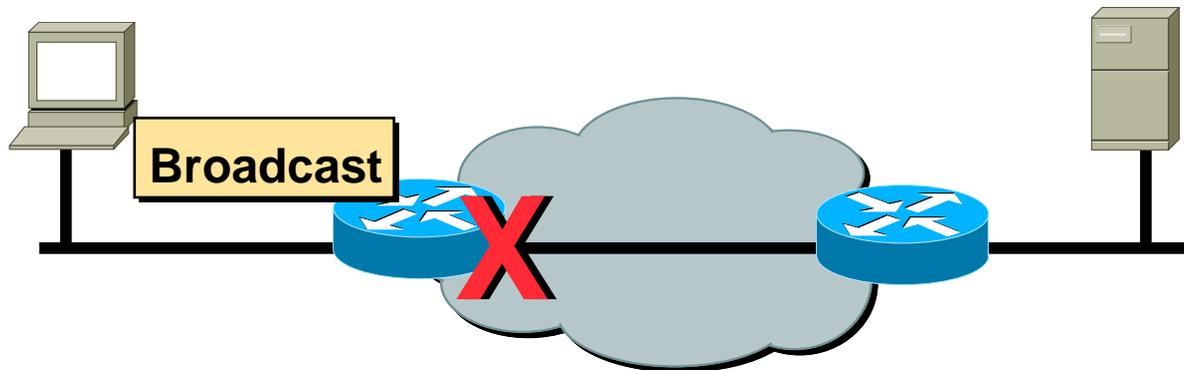

Configuring IP Access Lists

Managing IP Traffic Overview

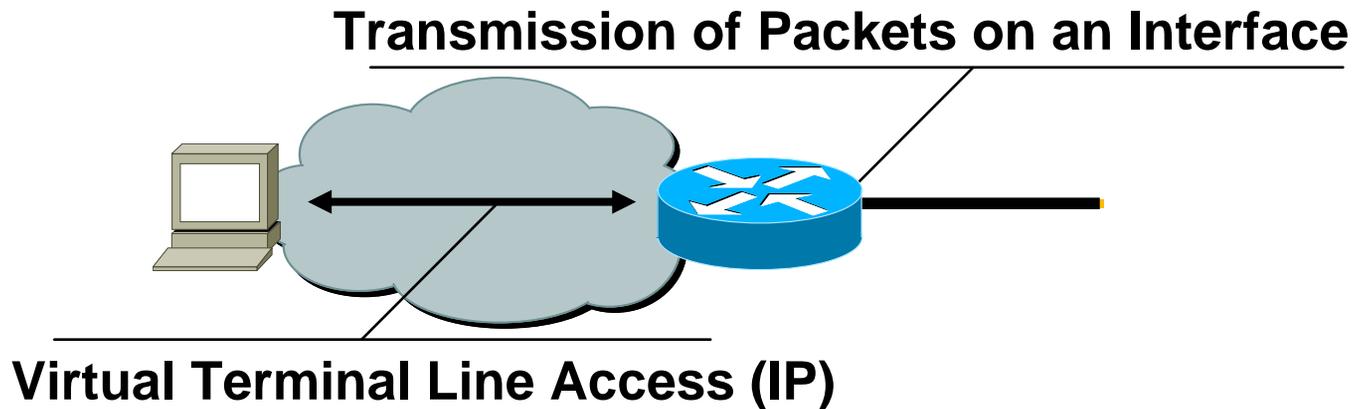

- **Limit traffic and restrict network use**

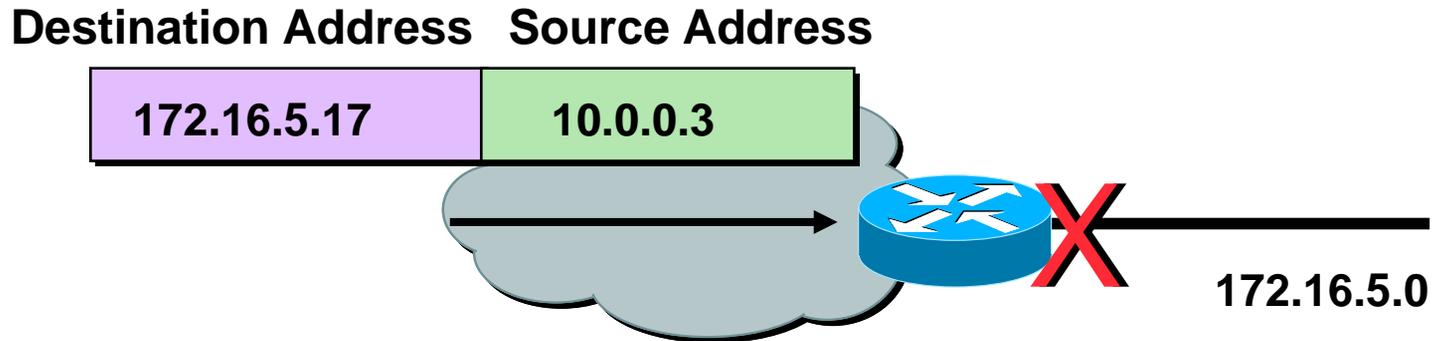

- **Enable directed forwarding of broadcasts**

Access List Applications

- **Access lists control packet movement through a network**

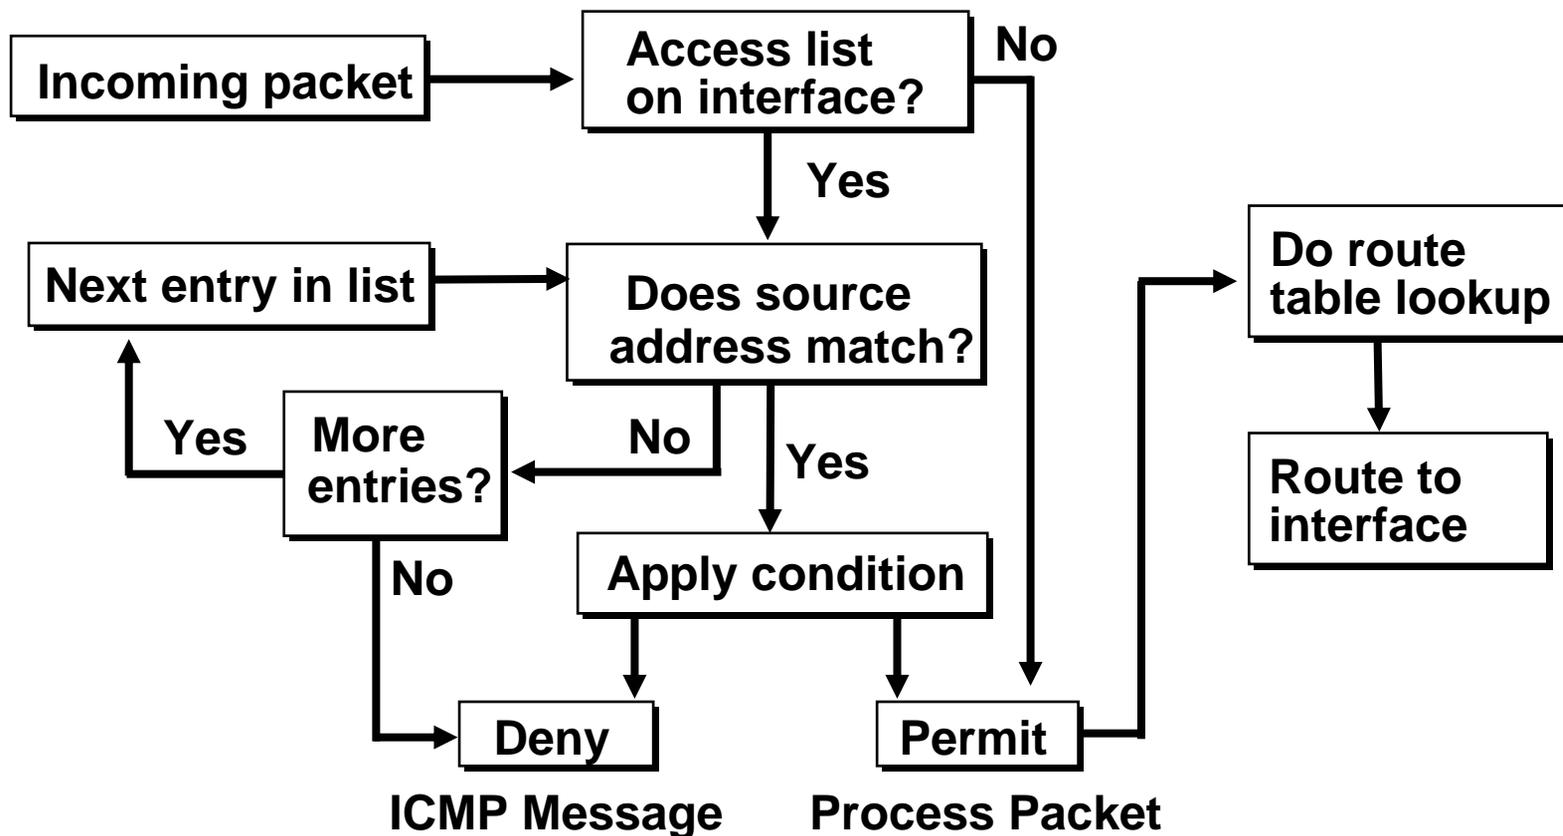

IP Standard Access Lists Overview

- Use source address only
- Access list range: 1 to 99

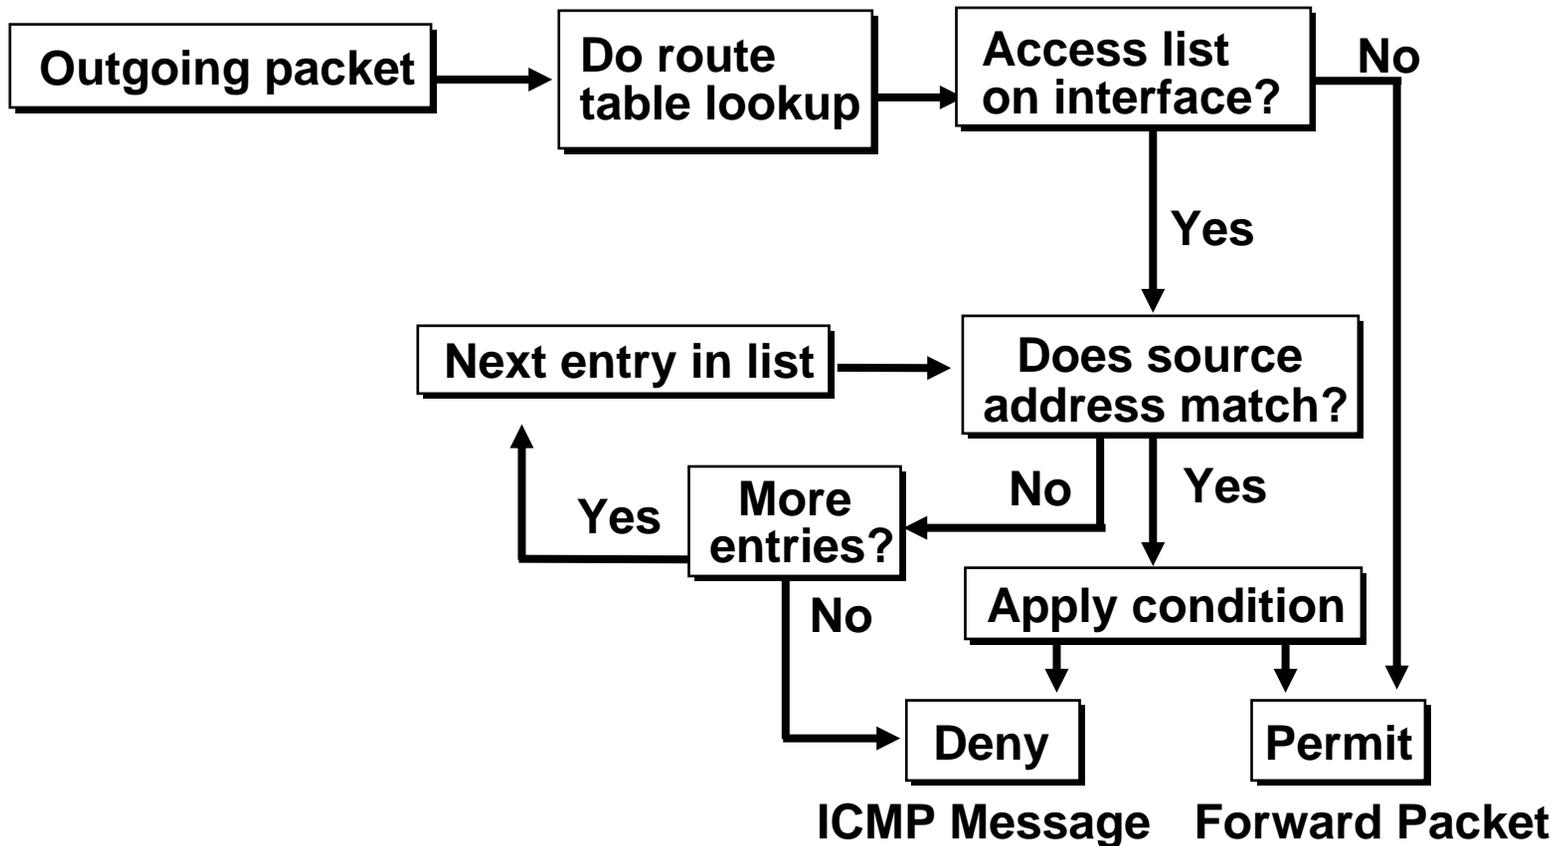

Inbound Access List Processing

For Standard IP Access Lists

Outbound Access List Processing

For Standard IP Access Lists

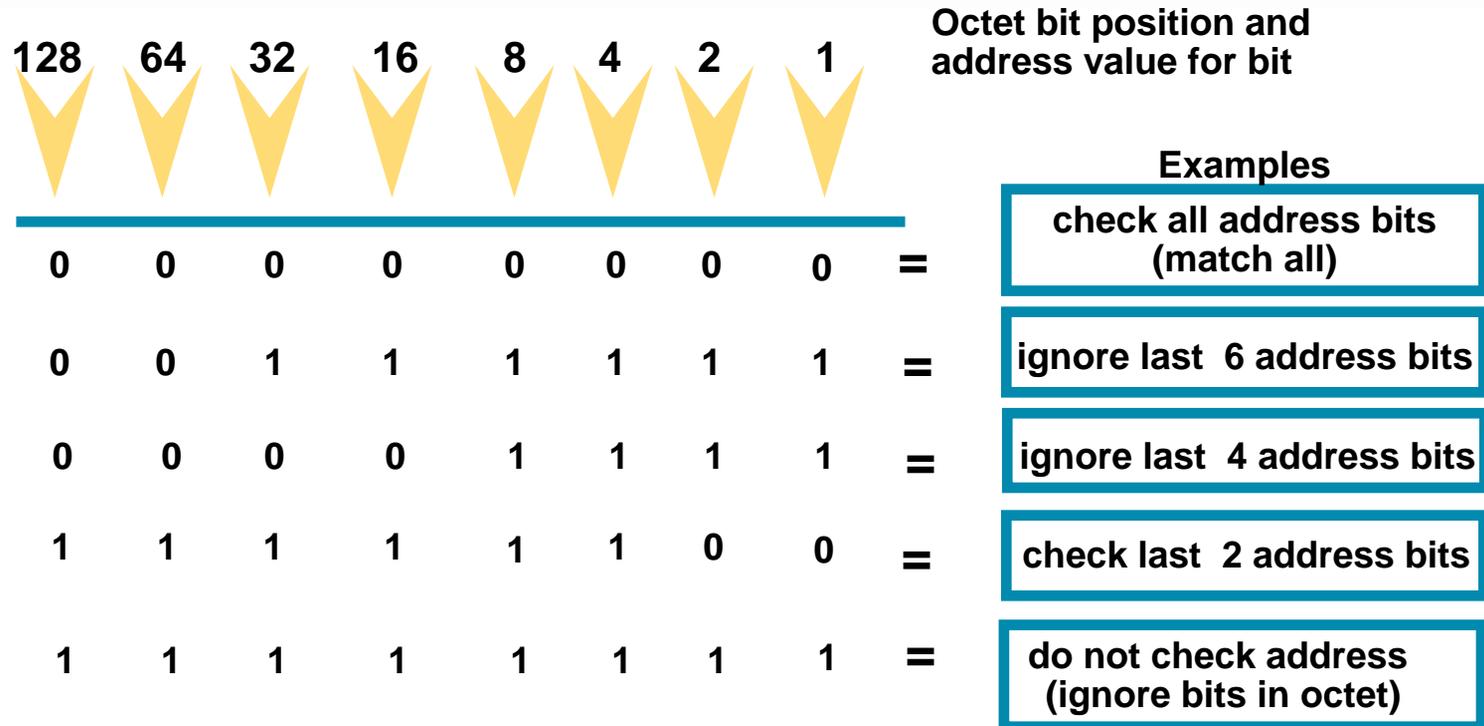

Access Lists Use Wildcard Mask

Address	Mask	Matches
0.0.0.0	255.255.255.255	any address
131.108.0.0/16	0.0.255.255	network 131.108.0.0
131.104.7.11/16	0.0.0.0	host or subnet address
255.255.255.255	0.0.0.0	local broadcast
131.111.8.0	0.0.7.255	only subnet 131.111.8.0 *

- **0 bit = must match bits in addresses**
- **1 bit = no need to match bits in addresses**

* Assuming subnet mask of 255.255.248.0

Wildcard Bits: How to Check the Corresponding Address Bits

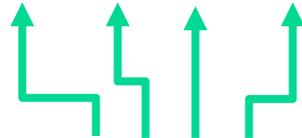

- 0 means check corresponding address bit value
- 1 means ignore value of corresponding address bit

Wildcard Bits to Match a Specific IP Host Address

Test conditions: Check all the address bits (match all)

An IP host address, for example:

172.30.16.29

Wildcard mask: 0.0.0.0
(checks all bits)

- Example **172.30.16.29 0.0.0.0** checks all the address bits
- Abbreviate this wildcard mask using the IP address preceded by the keyword *host* (***host 172.30.16.29***)

Wildcard Bits to Match Any IP Address

Test conditions: Ignore all the address bits (match any)

Any IP address

0.0.0.0

Wildcard mask: 255.255.255.255

(ignore all)

- Accept any address: **0.0.0.0 255.255.255.255**
- Abbreviate the expression using the keyword *any*

Wildcard Bits to Match IP Subnets

Check for IP subnets 172.30.16.0/24 to 172.30.31.0/24
Address and wildcard mask:

172.30.16.0 0.0.15.255

Network .host

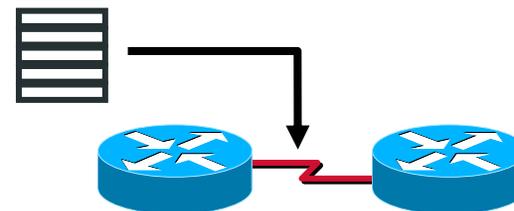

172.30.16.0

Wildcard mask:

	0	0	0	1	0	0	0	0		
	0	0	0	0	1	1	1	1		
	<----- match ----->			<----- don't care ----->						
	0	0	0	1	0	0	0	0	=	16
	0	0	0	1	0	0	0	1	=	17
	0	0	0	1	0	0	1	0	=	18
				:						:
	0	0	0	1	1	1	1	1	=	31

Access List Configuration Tasks

- To create an access list, perform the following tasks:
 - Define an access list
 - Apply the list to an interface

Standard Access List Commands

Router(config)#

```
access-list access-list-number { permit | deny }  
  { source [ source-wildcard ] | any }
```

- **Defines a standard access list (numbered 1-99)**

Router(config-if)#

```
ip access-group access-list-number { in | out }
```

- **Applies an access list to a specific interface**

Implicit Masks

For Standard IP Access Lists

Correct

```
access-list 1 permit 131.108.5.17
```

!

Common Errors

```
access-list 1 permit 0.0.0.0
```

```
access-list 1 permit 131.108.0.0
```

Not Needed

```
access-list 1 deny any
```

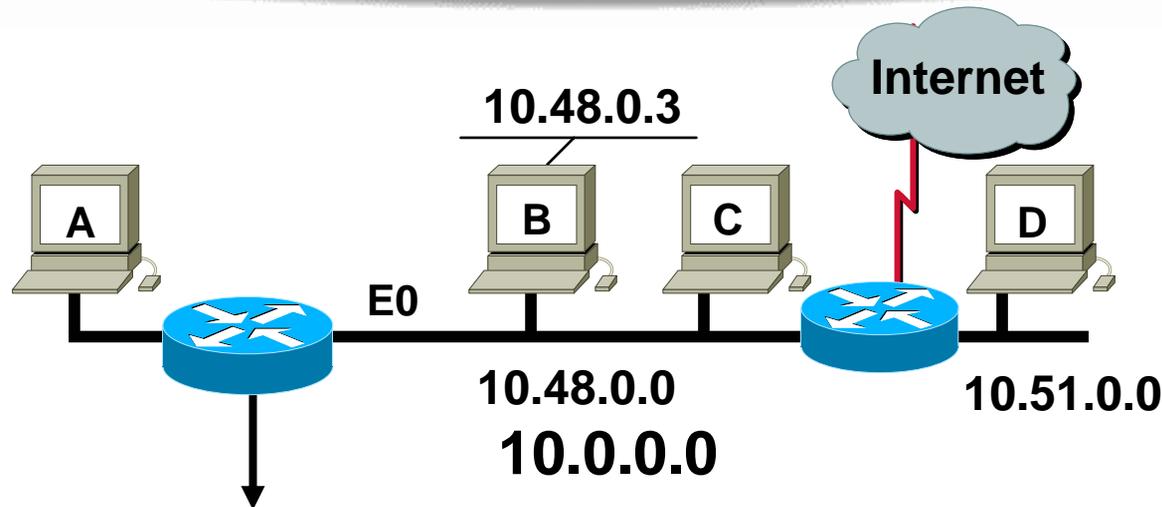

```
access-list 1 deny 0.0.0.0 255.255.255.255
```

- Omitted mask assumed to be 0.0.0.0
- Last two lines unnecessary (implicit deny any)

Configuration Principles

- **Top-down processing**
 - Place more specific references first
- **Implicit deny any**
 - Unless access list ends with explicit permit any
- **New lines added to the end**
 - Cannot selectively add/remove lines
- **Undefined access list = permit any**
 - Need to create access list lines for implicit deny any

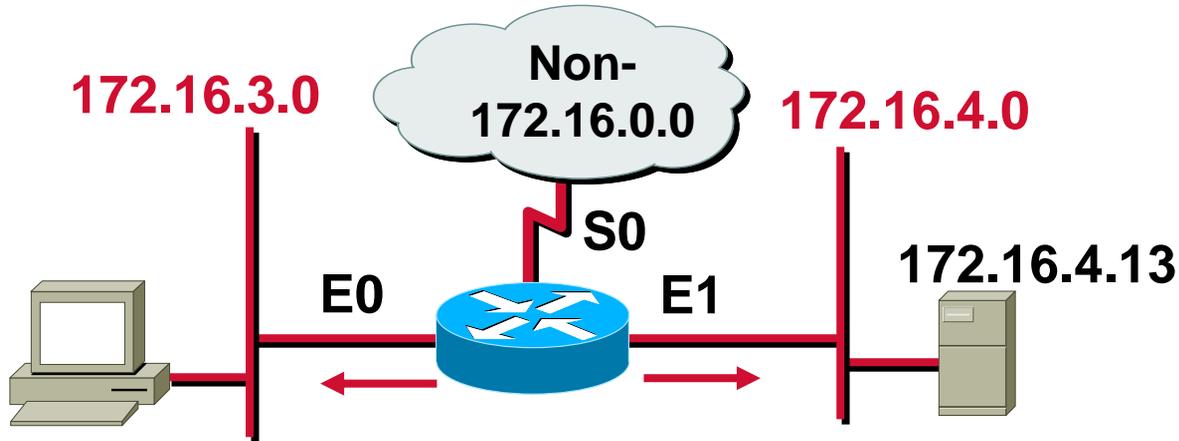

Standard IP Access List Example 1

```
Router(config)#access-list 2 permit 10.48.0.3
Router(config)#access-list 2 deny 10.48.0.0 0.0.255.255
Router(config)#access-list 2 permit 10.0.0.0 0.255.255.255
Router(config)#!(Note: all other access implicitly denied)
Router(config)#interface ethernet 0
Router(config-if)#ip access-group 2 in
```

- Who can connect to A?

Standard IP Access List Example 2

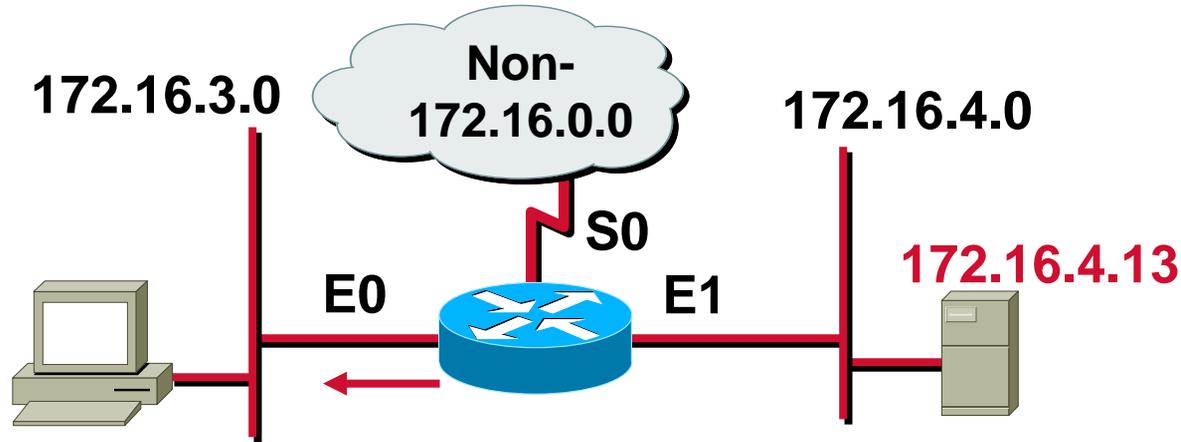

```
access-list 1 permit 172.16.0.0 0.0.255.255  
(implicit deny all - not visible in the list)  
(access-list 1 deny 0.0.0.0 255.255.255.255)
```

```
interface ethernet 0  
ip access-group 1 out  
interface ethernet 1  
ip access-group 1 out
```

- Permit my network only

Standard IP Access List Example 3

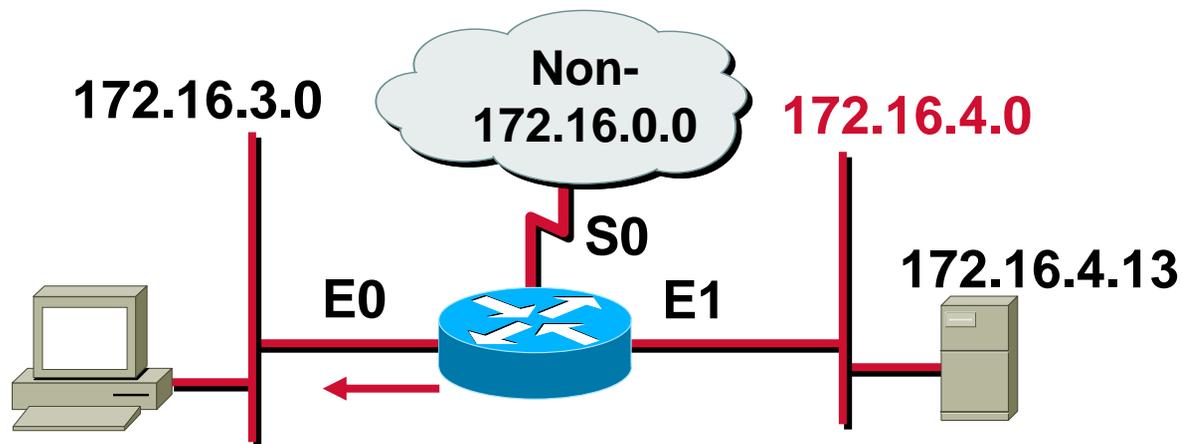

```
access-list 1 deny 172.16.4.13 0.0.0.0
access-list 1 permit 0.0.0.0 255.255.255.255
(implicit deny all)
(access-list 1 deny 0.0.0.0 255.255.255.255)

interface ethernet 0
ip access-group 1 out
```

- Deny a specific host

Standard IP Access List Example 4

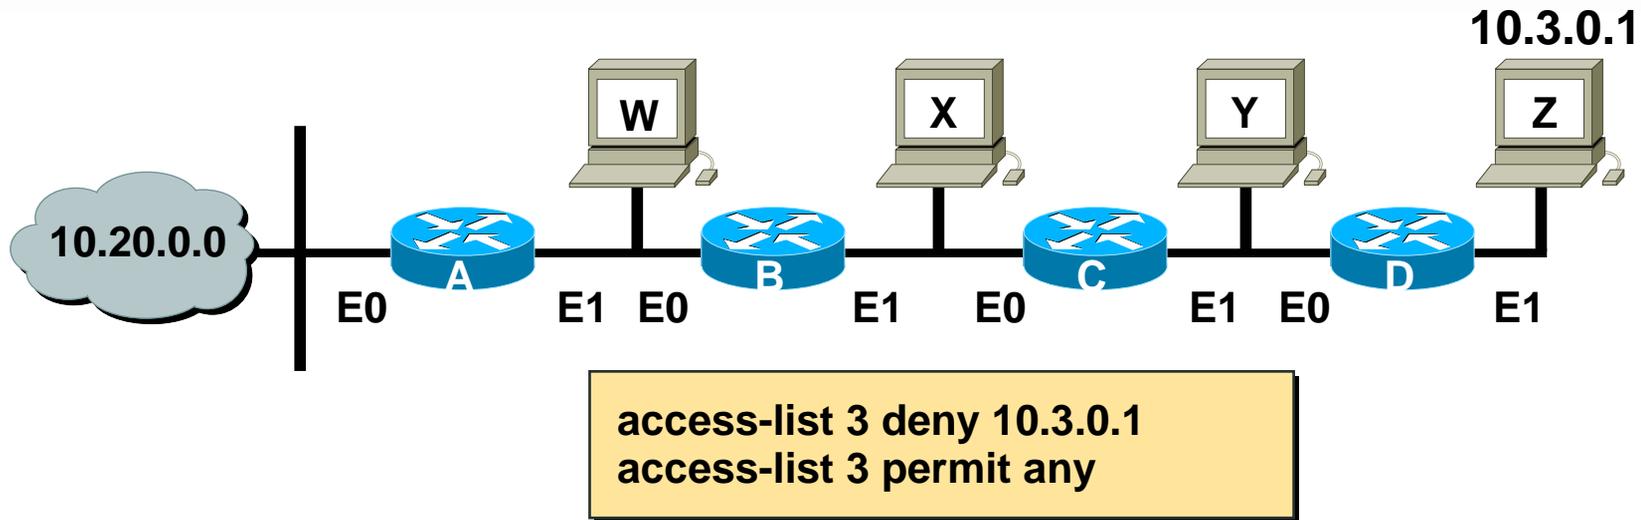

```
access-list 1 deny 172.16.4.0 0.0.0.255
access-list 1 permit any
(implicit deny all)
(access-list 1 deny 0.0.0.0 255.255.255.255)

interface ethernet 0
ip access-group 1 out
```

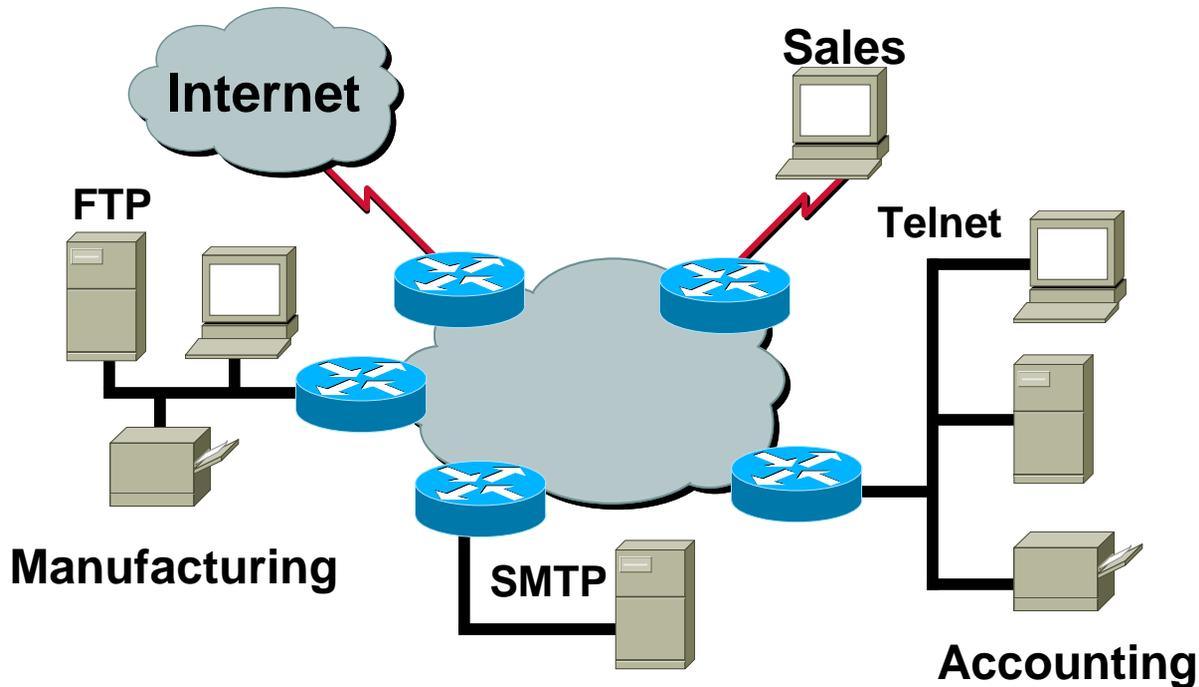

- Deny a specific subnet

Location of Standard Access Lists

- On which router should the access list be configured to deny host Z access to network 10.20.0.0?
- How does location of a standard access list change the policy implemented?

IP Extended Access List Overview

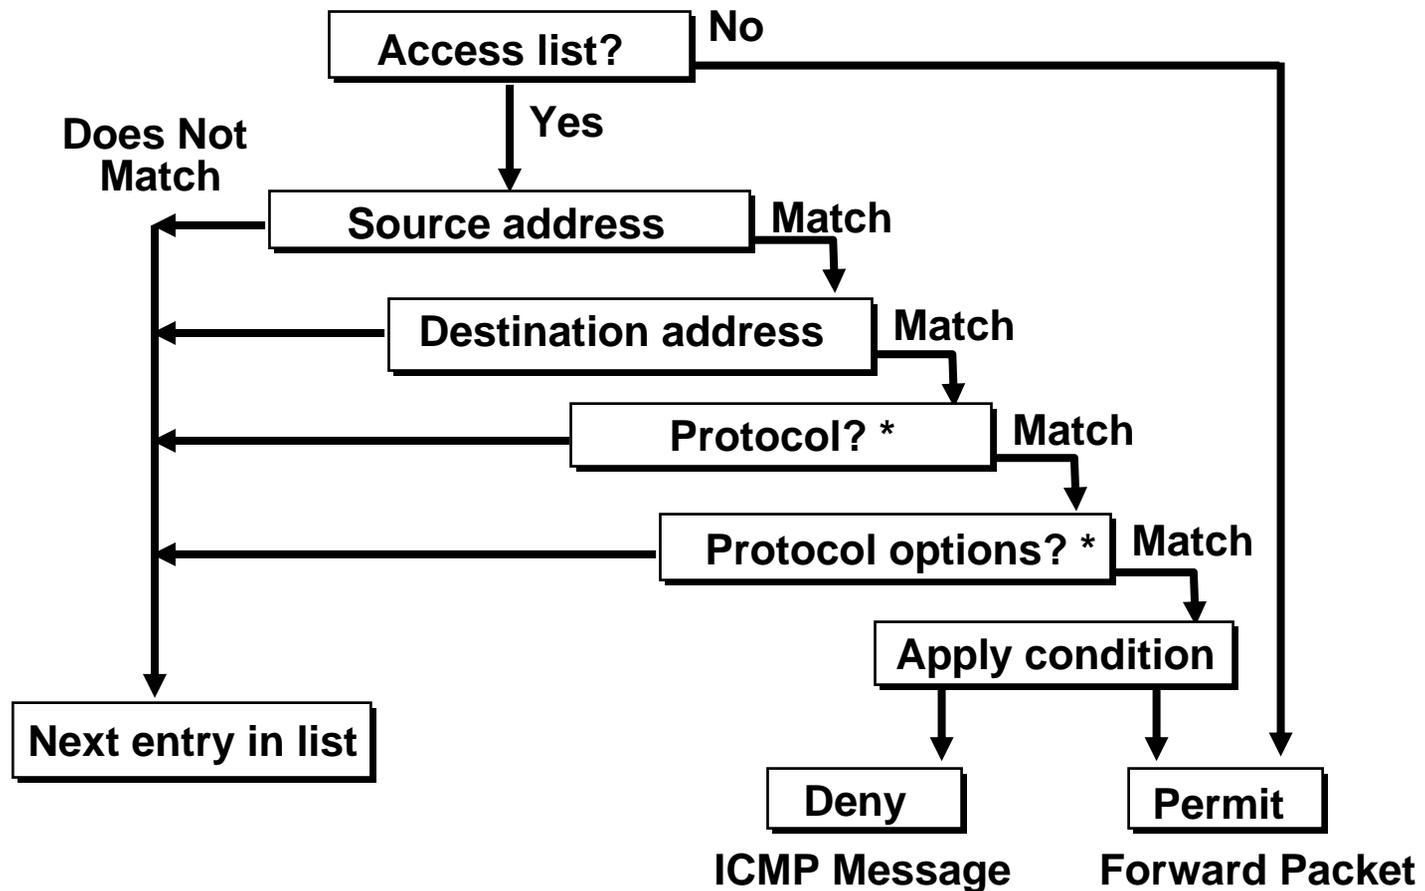

- **Control traffic by application, not just address**

Standard versus External Access List

Standard	Extended
Filters Based on Source.	Filters Based on Source and destination.
Permit or deny entire TCP/IP protocol suite.	Specifies a specific IP protocol and port number.
Range is 1 through 99	Range is 100 through 199.

Extended Access List Processing

* If present in access list

Extended IP Access List Command

Router(config)#

```
access-list access-list-number { permit | deny }  
    { protocol | protocol-keyword }  
    { source source-wildcard | any }  
    { destination destination-wildcard | any }  
    [ protocol-specific options ] [ log ]
```

- Defines an extended access list (numbered 100 to 199)
- Protocol keywords icmp, tcp, and udp define alternate syntax with protocol-specific options

Extended Mask Keywords

```
access-list 101 permit ip 0.0.0.0 255.255.255.255 0.0.0.0 255.255.255.255  
! (alternate configuration)  
access-list 101 permit ip any any
```

- The keyword *any* can be used in place of the address 0.0.0.0. with mask 255.255.255.255

```
access-list 101 permit ip 0.0.0.0 255.255.255.255 172.16.5.17 0.0.0.0  
! (alternate configuration)  
access-list 101 permit ip any host 172.16.5.17
```

- The keyword *host* preceding an *ip-address* can be used in place of the mask 0.0.0.0

ICMP Command Syntax

Router(config)#

```
access-list access-list-number { permit | deny } icmp  
    { source source-wildcard | any }  
    { destination destination-wildcard | any }  
    [ icmp-type [ icmp-code ] | icmp-message ]
```

- **Filters based on ICMP messages**

ICMP Message and Type Names

administratively-prohibited	information reply	port unreachable
alternate-address	mask-reply	reassembly-timeout
conversion-error	mask-request	redirect
dod-host-prohibited	mobile-redirect	router-advertisement
dod-net-prohibited	net-redirect	router-solicitation
echo	net-tos-redirect	source-quench
echo-reply	net-tos-unreachable	source-route-failed
general-parameter-problem	net-unreachable	time-exceeded
host-isolated	network-unknown	traceroute
host-tos-redirect	no-room-for-option	ttl-exceeded
host-tos-unreachable	option-missing	unreachable
host-unknown	packet-too-big	
host-unreachable	parameter-problem	

- **Names simplify configuration**

TCP Syntax

Router(config)#

```
access-list access-list-number { permit | deny } tcp  
    { source source-wildcard | any }  
    [ operator source-port | source-port ]  
    { destination destination-wildcard | any }  
    [ operator destination-port | destination-port ]  
    [ established ]
```

- **Filters based on tcp/tcp port number or name**

TCP Port Names

bgp	gopher	sunrpc
chargen	hostname	syslog
daytime	irc	tacacs-ds
discard	klogin	talk
domain	kshell	telnet
echo	lpd	time
finger	nntp	uucp
ftp control	pop2	whois
ftp-data	pop3	www

- Enter ? to get port numbers corresponding to names
- Other port numbers found in the Assigned Numbers RFC

UDP Syntax

Router(config)#

```
access-list access-list-number { permit | deny } udp  
  { source source-wildcard | any }  
  [ operator source-port | source-port ]  
  { destination destination-wildcard | any }  
  [ operator destination-port | destination-port ]
```

- Filters based on UDP protocol or UDP port number or name

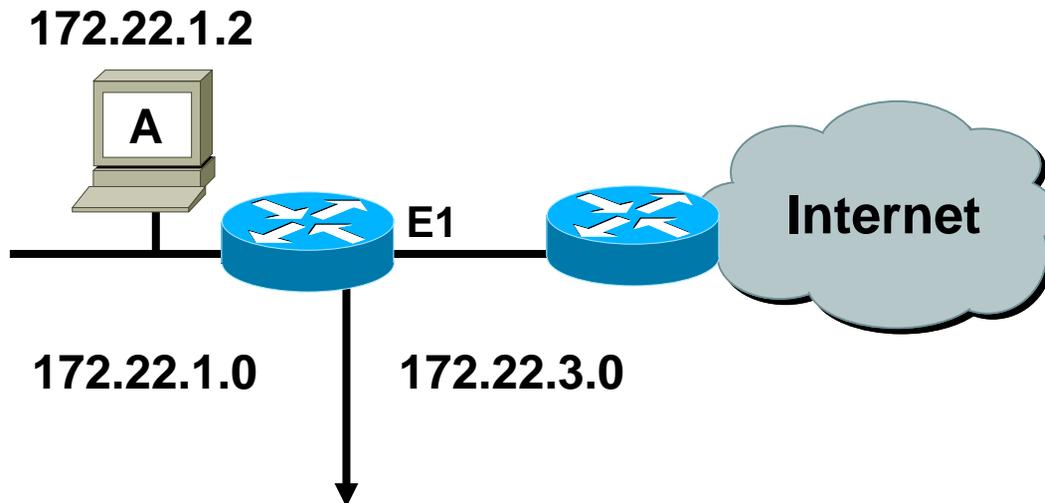

UDP Port Names

biff	nameserver	syslog
bootpc	netbios-dgm	tacasds-ds
bootps	netbios-ns	talk
discard	ntp	tftp
dns	rip	time
dnsix	snmp	whois
echo	snmptrap	xmcp
mobile-ip	sunrpc	

- **Enter ? to get port numbers corresponding to the name**
- **Other port numbers found in the Assigned Numbers RFC**

Extended Access List Example 1

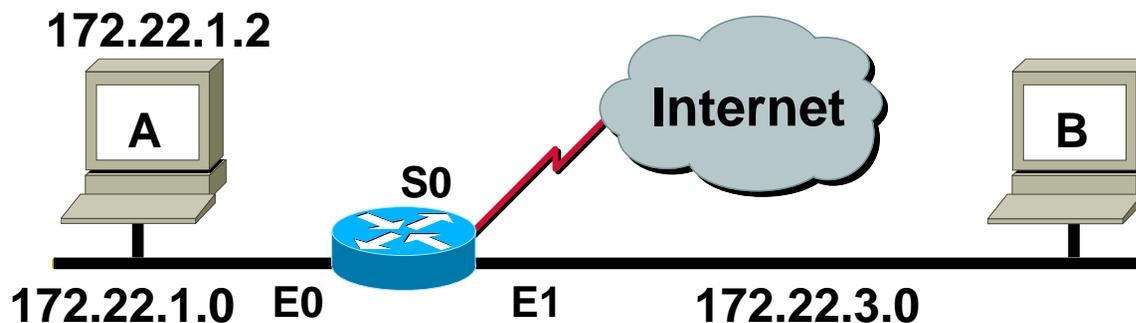

Providing Internet Mail

```
access-list 103 permit tcp any 172.22.0.0 0.0.255.255 established
access-list 103 permit tcp any host 172.22.1.2 eq smtp
!
interface ethernet 1
ip access-group 103 in
```

Extended Access List Example 2

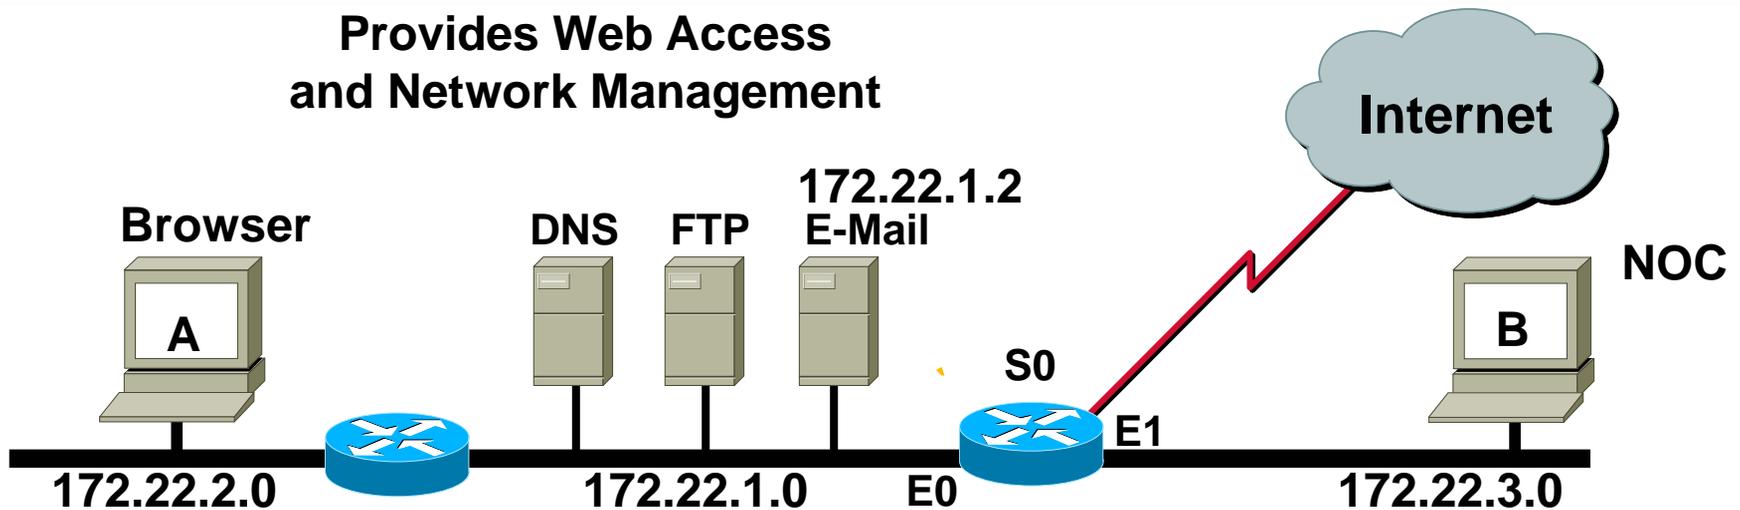

Also Providing DNS and Ping

```
access-list 104 permit tcp any 172.22.0.0 0.0.255.255 established
access-list 104 permit tcp any host 172.22.1.2 eq smtp
access-list 104 permit udp any any eq dns
access-list 104 permit icmp any any echo
access-list 104 permit icmp any any echo-reply
!
interface serial 0
ip access-group 104 in
```

Extended Access List Example 3

Provides Web Access
and Network Management

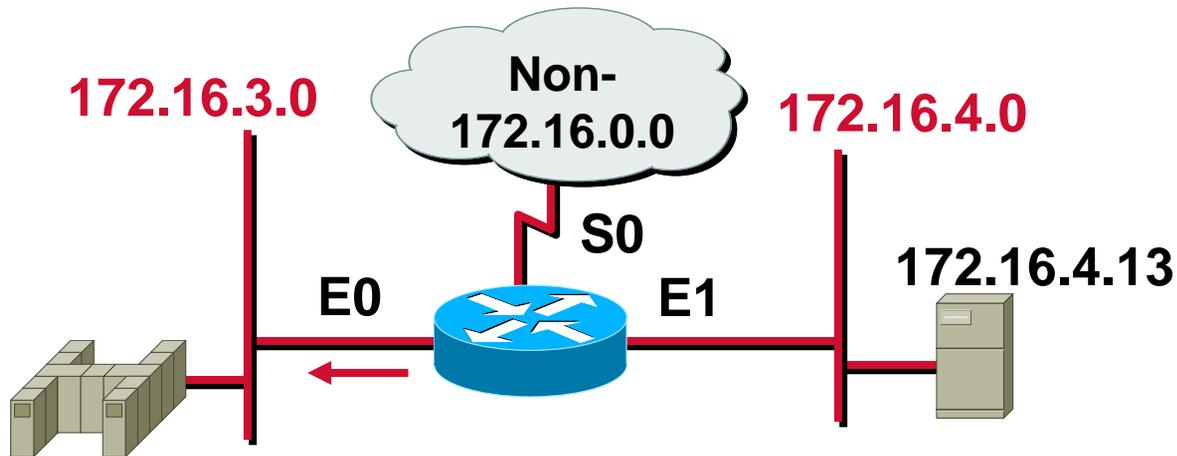

```
access-list 118 permit tcp any 172.22.0.0 0.0.255.255 eq www established
access-list 118 permit tcp any host 172.22.1.2 eq smtp

access-list 118 permit udp any any eq dns
access-list 118 permit udp 172.22.3.0 0.0.0.255 172.22.1.0 0.0.0.255 eq snmp

access-list 118 deny icmp any 172.22.0.0 0.0.255.255 echo
access-list 118 permit icmp any any echo-reply
!
interface ethernet 0
ip access-group 118 out
```

Extended Access List Example 4

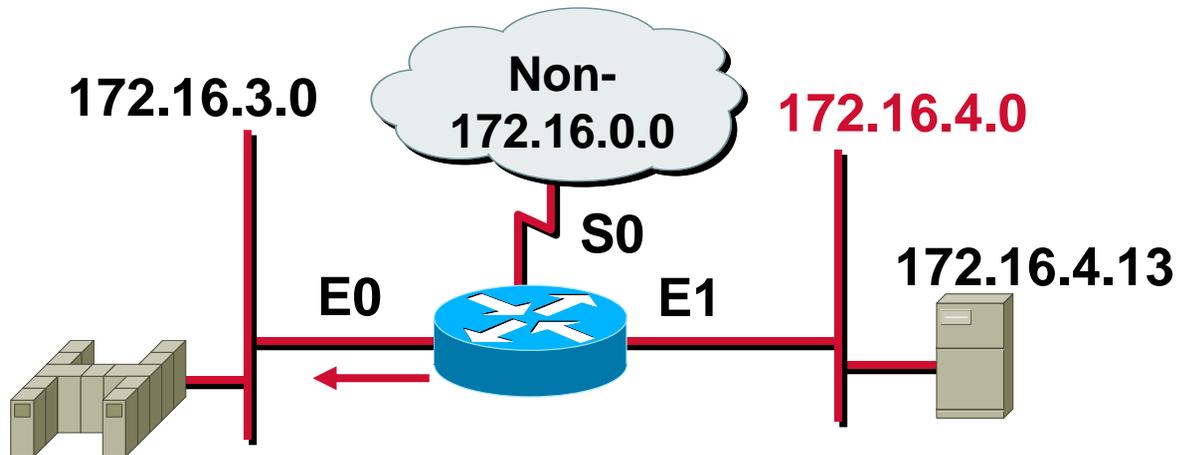

```
access-list 101 deny tcp 172.16.4.0 0.0.0.255 172.16.3.0 0.0.0.255 eq 21
access-list 101 deny tcp 172.16.4.0 0.0.0.255 172.16.3.0 0.0.0.255 eq 20
access-list 101 permit ip any any
(implicit deny all)
(access-list 101 deny ip 0.0.0.0 255.255.255.255 0.0.0.0 255.255.255.255)
```

```
interface ethernet 0
ip access-group 101 out
```

- Deny FTP from subnet 172.16.4.0 to subnet 172.16.3.0 out of E0
- Permit all other traffic

Extended Access List Example 5

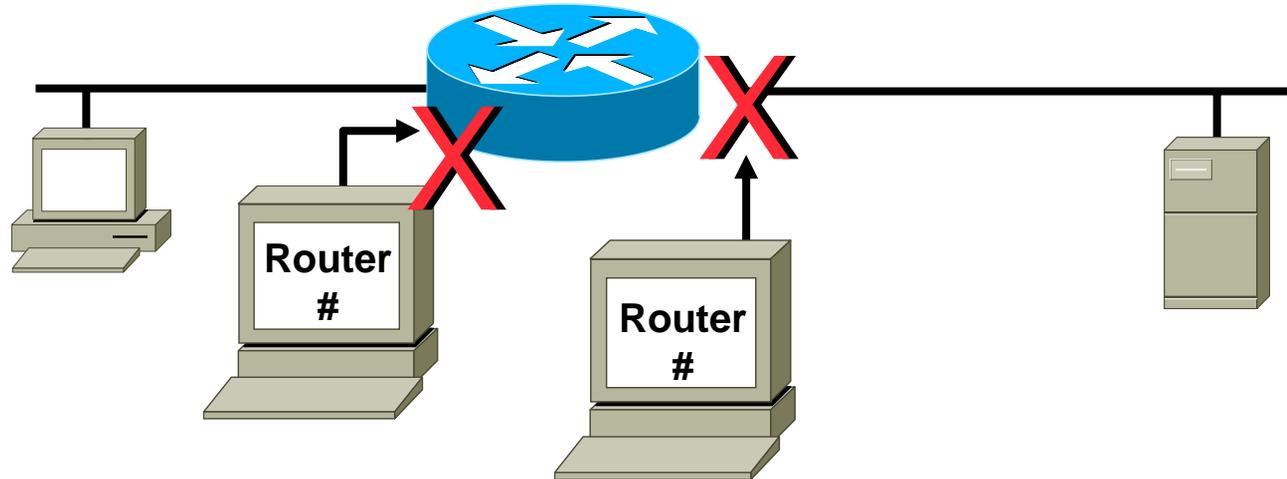

```
access-list 101 deny tcp 172.16.4.0 0.0.0.255 any eq 23
access-list 101 permit ip any any
(implicit deny all)
```

```
interface ethernet 0
ip access-group 101 out
```

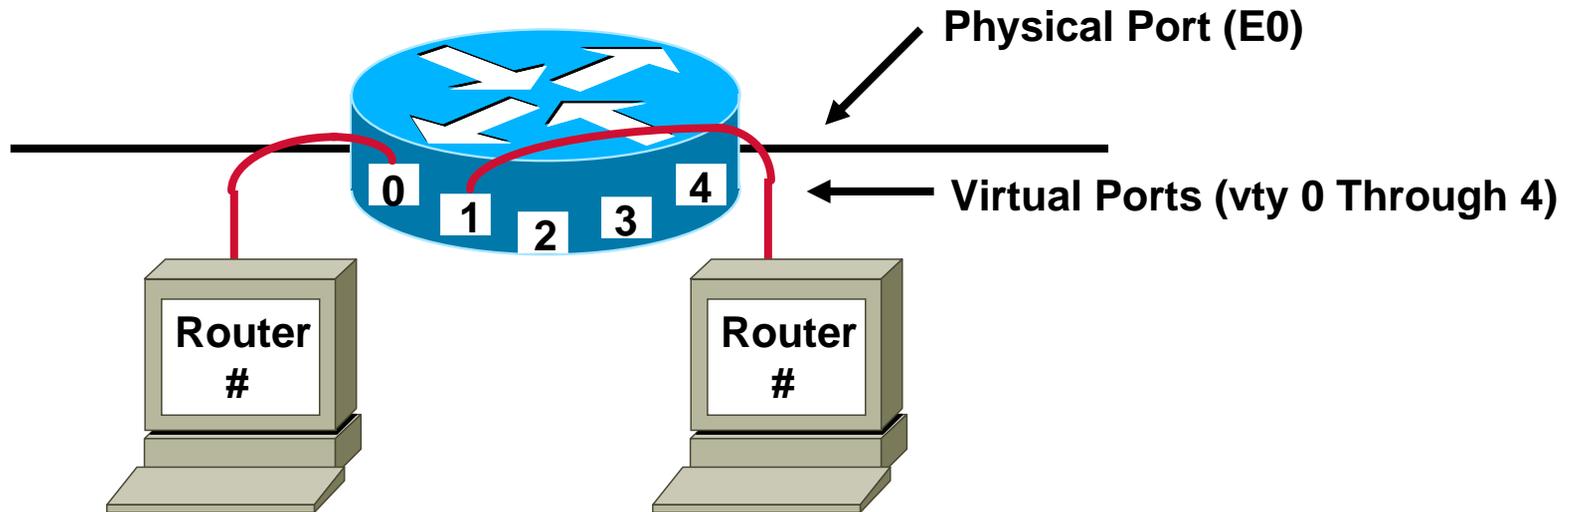

- Deny only Telnet from subnet 172.16.4.0 out of E0
- Permit all other traffic

Virtual Terminal Access Overview

- **Standard and extended access lists will not block access from the router**
- **For security, virtual terminal (vty) access can be blocked to or from the router**

How to Control vty Access

- **Five virtual terminal lines (0 through 4)**
- **Set identical restrictions on all the virtual terminal lines**

Virtual Terminal Line Commands

Router(config)#

```
line vty { vty-number | vty-range }
```

- Enters configuration mode for a terminal line or a range of lines

Router(config-line)#

```
access-class access-list-number { in | out }
```

- Restricts incoming and outgoing connections between a particular virtual terminal line (into a device) and the addresses in an access list

Virtual Terminal Access Example

Controlling Inbound Access

```
access-list 12 permit 192.89.55.0 0.0.0.255
```

```
!
```

```
line vty 0 4
```

```
access-class 12 in
```

- **Permits only hosts in network 192.89.55.0 to connect to the virtual terminal ports on the router**

Access List show Commands

Router#

```
show access-list
```

- Displays access lists from all protocols

Router#

```
show ip access-list [ access-list-number ]
```

- Displays a specific IP access list

Router#

```
clear access-list counters [ access-list-number ]
```

- Clears packet counts

Router#

```
show line
```

- Displays line configuration

show ip access-lists Command

```
p1r1#show access-lists
```

```
Extended IP access list 100
```

```
deny tcp host 10.1.1.2 host 10.1.1.1 eq telnet (3 matches)
```

```
deny tcp host 10.1.2.2 host 10.1.2.1 eq telnet
```

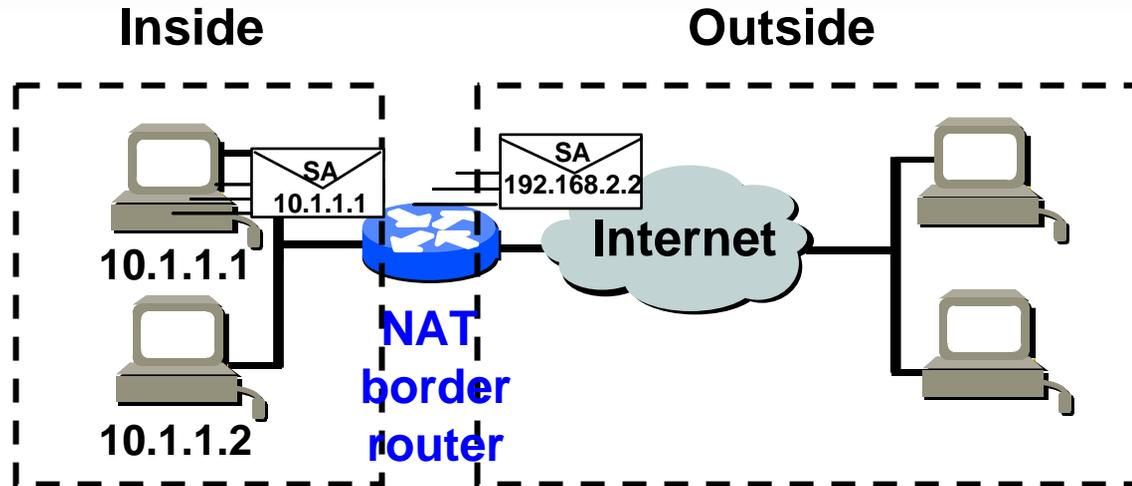

```
permit ip any any (629 matches)
```

- Matches are shown for extended access lists

Network Address Translation

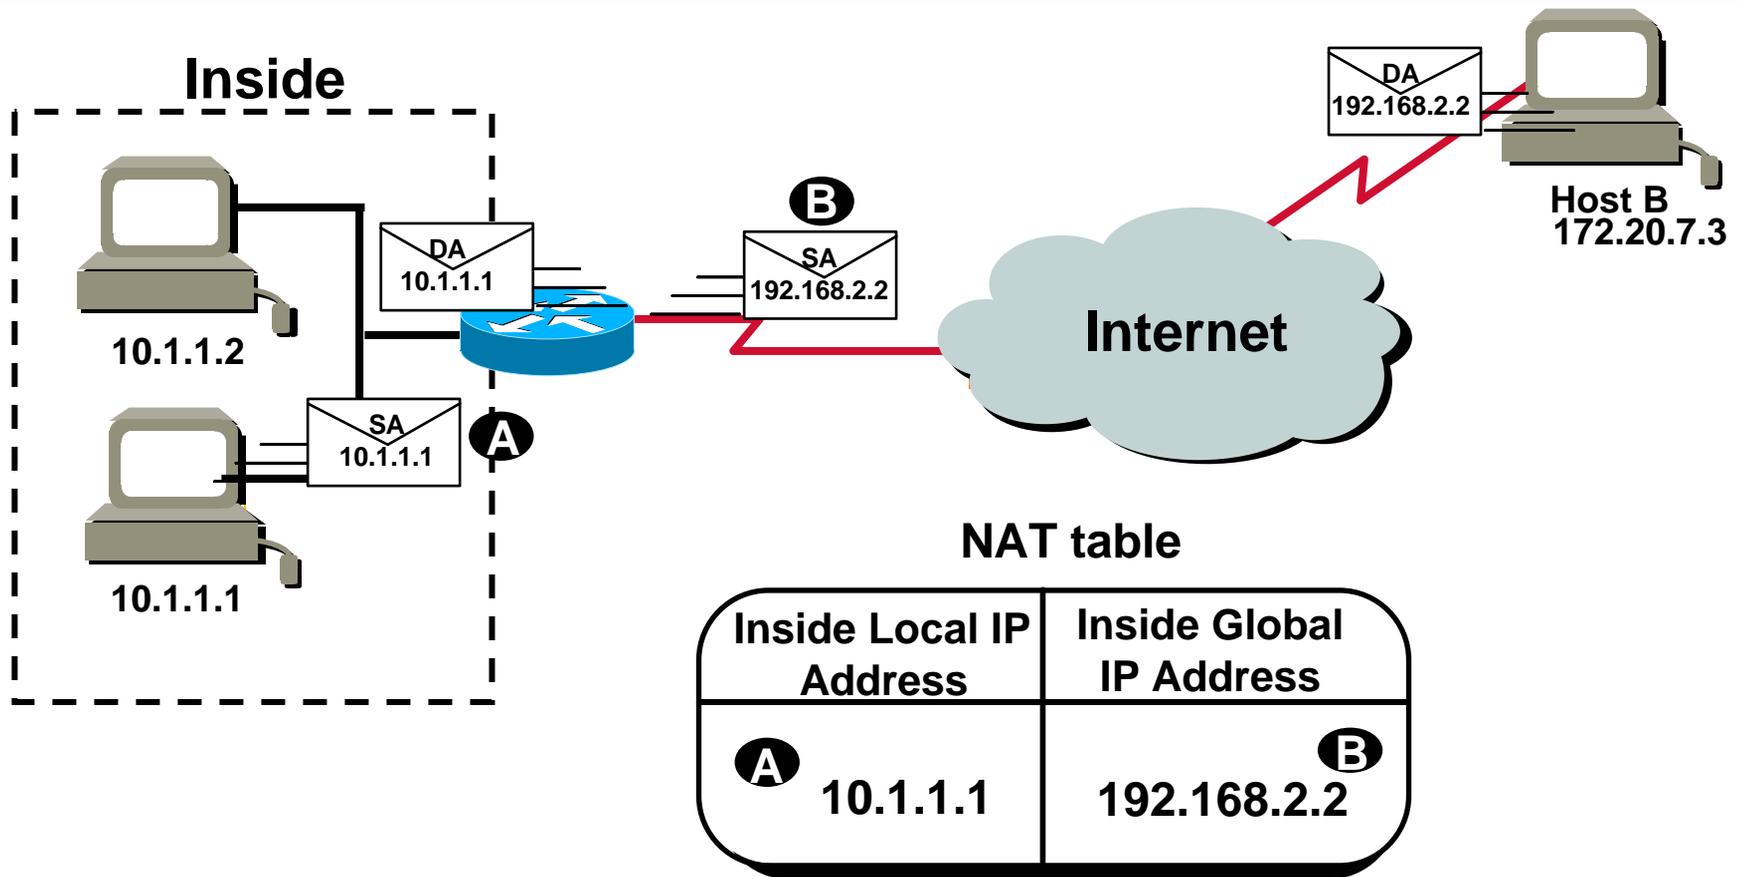

Why Use NAT?

Use NAT if:

- You need to connect to the Internet and your hosts do not have globally unique IP addresses
- You change over to a new ISP that requires you to renumber your network
- Two intranets with duplicate addresses merge
- You want to support basic load sharing

NAT Overview and Terminology

NAT Overview and Terminology

- **Inside local address**

—The IP address that is assigned to a host on the inside network. The address is probably not a legitimate IP address assigned by the Network Information Center (NIC) or service provider.

- **Inside global address**

—A legitimate IP address (assigned by the NIC or service provider) that represents one or more inside local IP addresses to the outside world.

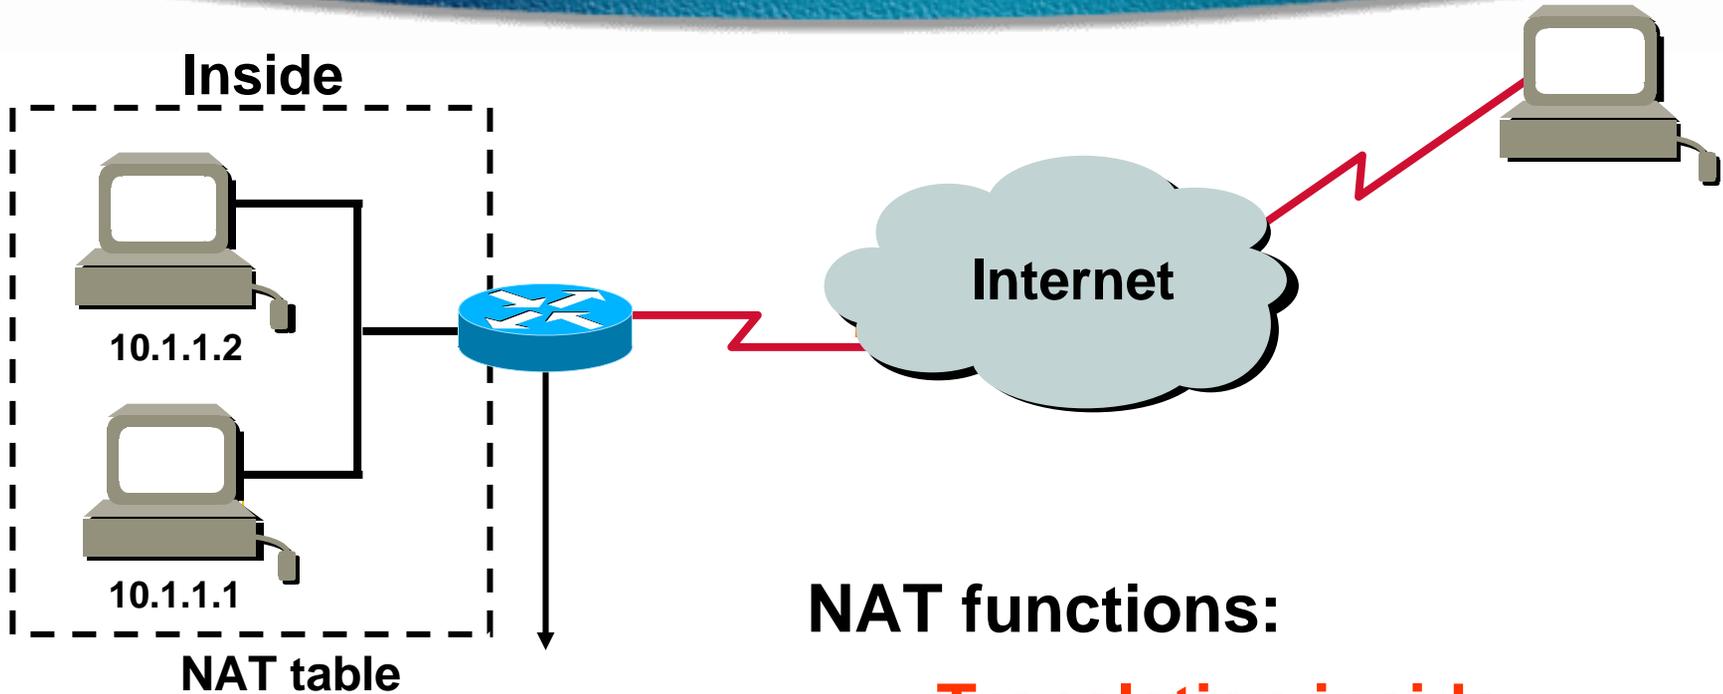

- **Outside local address**

—The IP address of an outside host as it appears to the inside network. Not necessarily a legitimate address, it was allocated from address space routable on the inside.

- **Outside global address**

—The IP address assigned to a host on the outside network by the host's owner. The address was allocated from globally routable address or network space.

NAT Operation

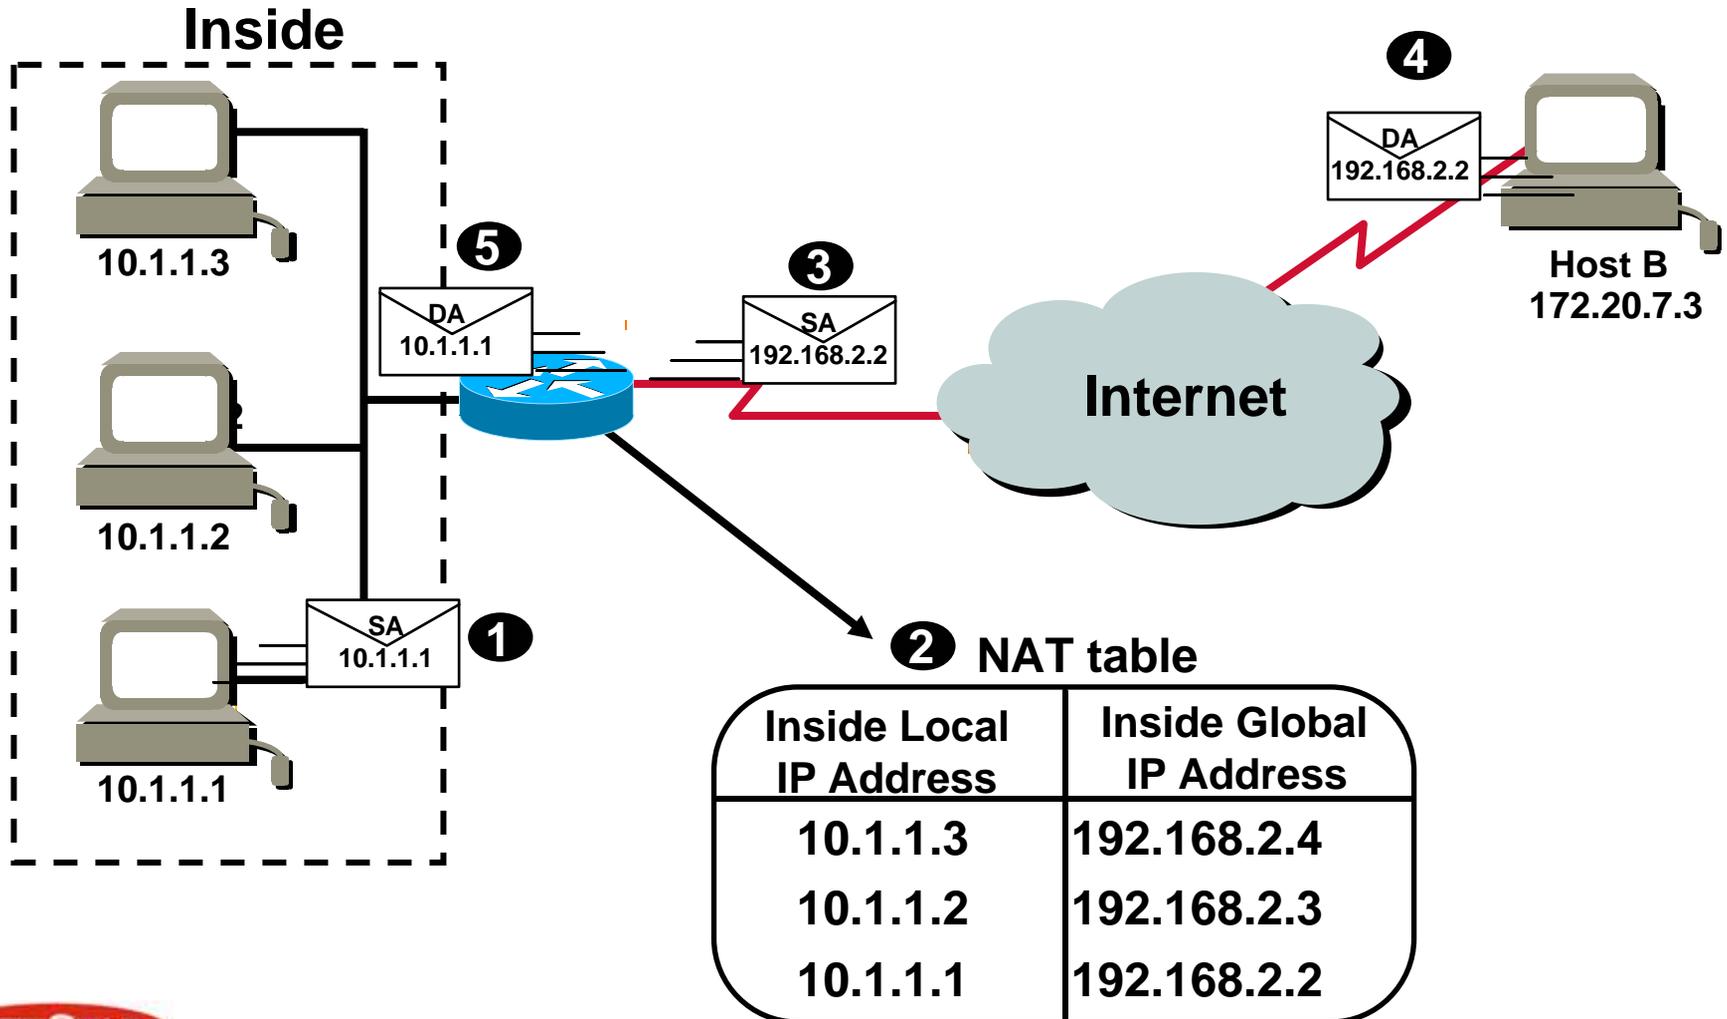

NAT functions:

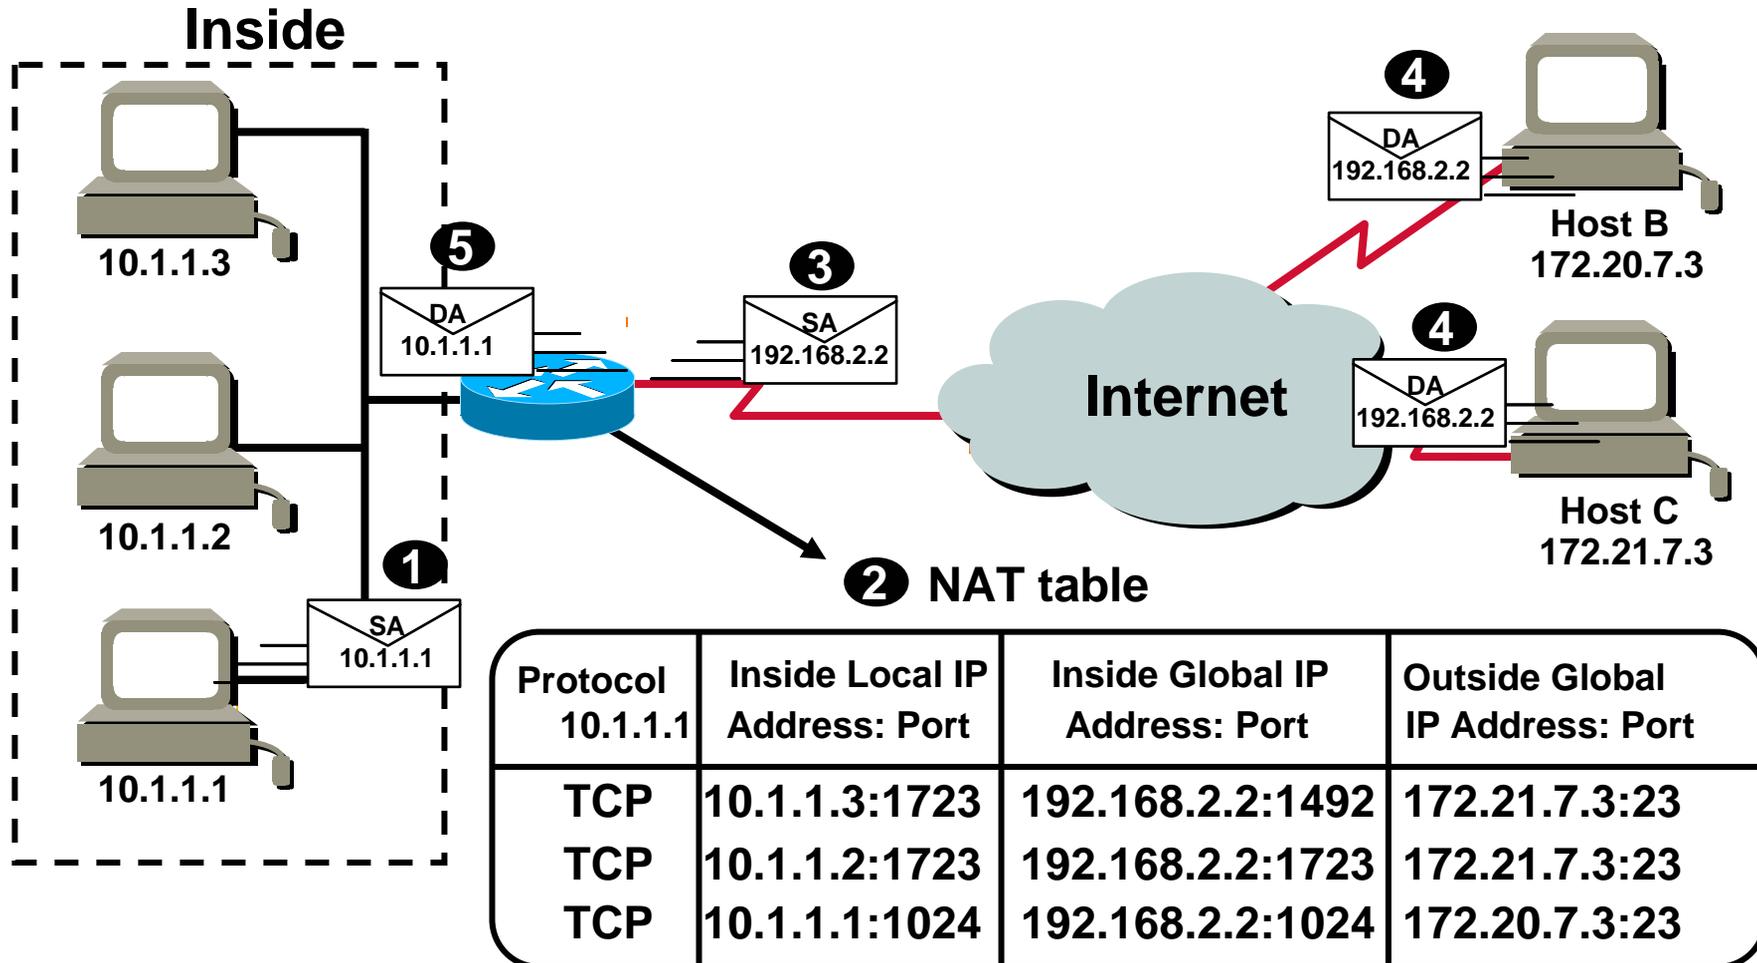

- Translation inside local addresses
- Overloading inside global addresses

Inside Local IP Address	Inside Global IP Address
10.1.1.1	192.168.2.2
10.1.1.2	192.168.2.3

Translating Inside Local Addresses

Overloading Inside Global Addresses

Static NAT Configuration Example

```
ip nat inside source static 10.1.1.1 192.168.2.2
!  
interface Ethernet0  
 ip address 10.1.1.10 255.255.255.0  
 ip nat inside  
!  
interface Serial0  
 ip address 172.16.2.1 255.255.255.0  
 ip nat outside  
!
```

This interface connected to the inside network.

This interface connected to the outside world.

Maps the inside local address to the inside global address.

Dynamic NAT Configuration

```
ip nat pool dyn-nat 192.168.2.1 192.168.2.254
  netmask 255.255.255.0
ip nat inside source list 1 pool dyn-nat
!
interface Ethernet0
  ip address 10.1.1.10 255.255.255.0
  ip nat inside
!
interface Serial0
  ip address 172.16.2.1 255.255.255.0
  ip nat outside
!
access-list 1 permit 10.1.1.0 0.0.0.255
!
```

This interface
connected to
the inside
network.

This interface
connected to
the outside
world.

Translate between inside hosts addressed from 10.1.1.0/24 to the globally unique 192.168.2.0/24 network.

Configuring Inside Global Address Overloading

```
ip nat pool ovrld-nat 192.168.2.1 192.168.2.2
    netmask 255.255.255.0
ip nat inside source list 1 pool ovrld-nat overload
!
interface Ethernet0/0
    ip address 10.1.1.10 255.255.255.0
    ip nat inside
!
interface Serial0/0
    ip address 172.16.2.1 255.255.255.0
    ip nat outside
!
access-list 1 permit 10.1.1.0 0.0.0.255
```

Verifying NAT

Basic IP address translation

```
Router#show ip nat trans
```

Pro	Inside global	Inside local	Outside local	Outside global
---	192.2.2.1	10.1.1.1	---	---
---	192.2.2.2	10.1.1.2	---	---

IP address translation with overloading

```
Router#sh ip nat trans
```

Pro	Inside global	Inside local	Outside local	Outside global
tcp	192.168.2.1:11003	10.1.1.1:11003	172.16.2.2:23	172.16.2.2:23
tcp	192.168.2.1:1067	10.1.1.1:1067	172.16.2.3:23	172.16.2.3:23

Unique TCP port numbers are used to distinguish between hosts.

A translation for a Telnet is still active.

Two different inside hosts appear on the outside with a single IP address.

Clearing NAT Translation Entries

```
Router#sh ip nat trans
Pro Inside global   Inside local   Outside local   Outside global
tcp 192.168.2.1:11003 10.1.1.1:11003 172.16.2.2:23 172.16.2.2:23
tcp 192.168.2.1:1067 10.1.1.1:1067 172.16.2.3:23 172.16.2.3:23
router#clear ip nat trans *
router#
router#show ip nat trans
```

▶ All entries are cleared.

```
router#show ip nat trans
Pro Inside global   Inside local   Outside local   Outside global
udp 192.168.2.2:1220 10.1.1.2:1120 171.69.2.132:53 171.69.2.132:53
tcp 192.168.2.1:11003 10.1.1.1:11003 172.16.2.2:23 172.16.2.2:23
tcp 192.168.2.1:1067 10.1.1.1:1067 172.16.2.3:23 172.16.2.3:23
router#clear ip nat trans udp inside 192.168.2.2 10.1.1.2 1220 171.69.2.132 53 171.69.2.132 53
router#show ip nat trans
Pro Inside global   Inside local   Outside local   Outside global
tcp 192.168.2.1:11003 10.1.1.1:11003 172.16.2.2:23 172.16.2.2:23
tcp 192.168.2.1:1067 10.1.1.1:1067 172.16.2.3:23 172.16.2.3:23
```

▶ 192.168.2.2 is cleared.

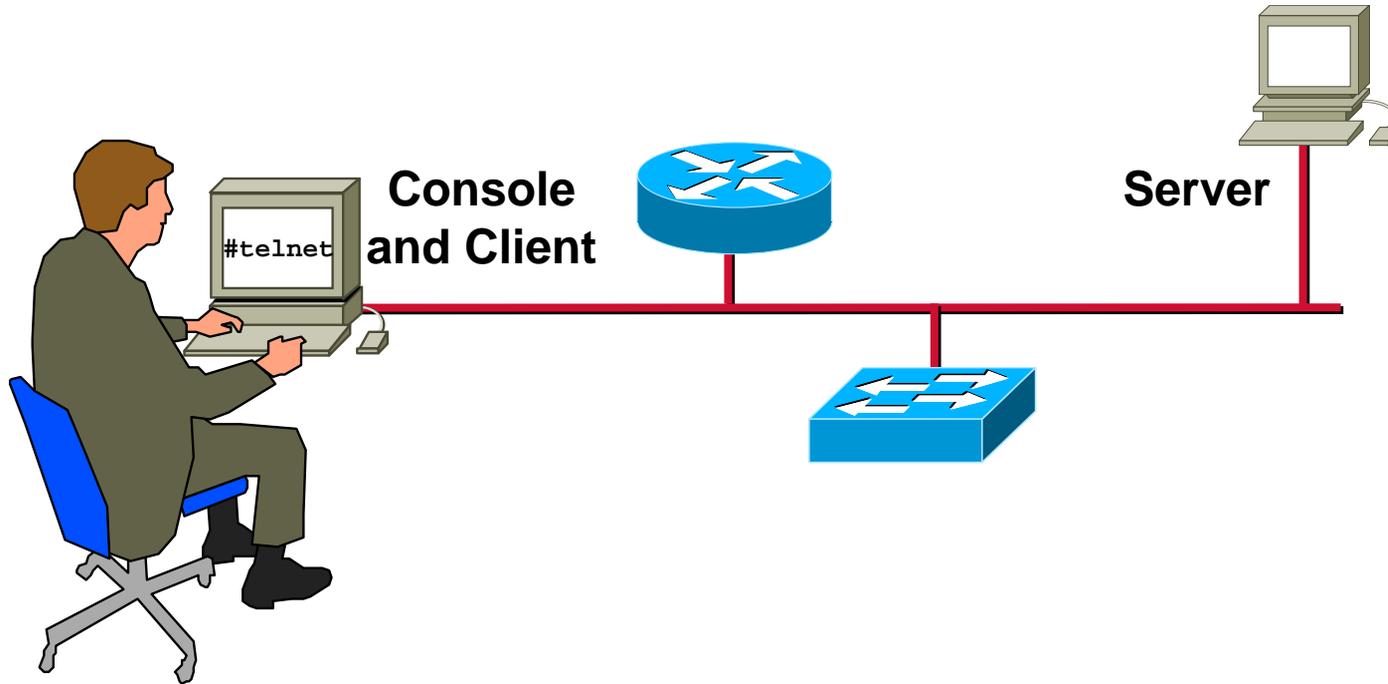

Troubleshooting Tools

Troubleshooting Tools

- **Cisco IOS tools and commands in the router**
- **Password recovery**
- **Router IOS Backup & Upgrade**

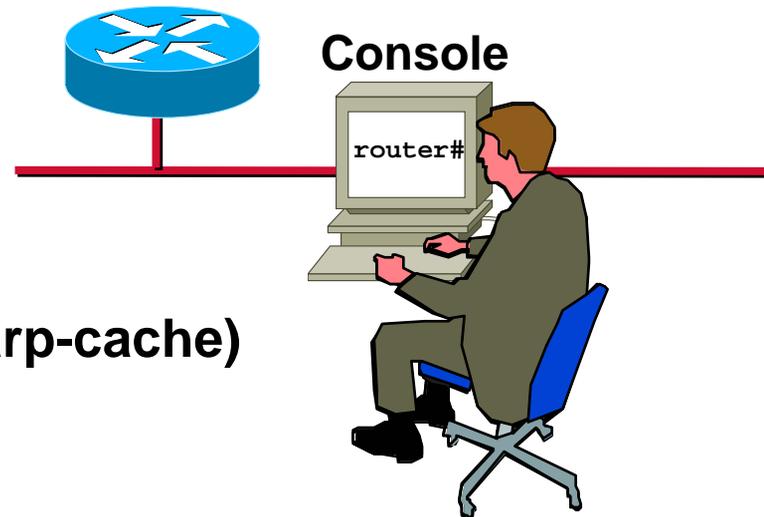

Use Built-In Tools for Troubleshooting

- **Cisco IOS tools and commands in the router**
- **TCP/IP tools included with Windows**

Cisco IOS Software Tools and Commands

- show ip interface
- clear counter
- show ip route
- show ip traffic
- show cdp neighbor
- show ip arp (and clear arp-cache)
- ping ip (privileged)
- Tracerotue (privileged)
- show process
- Show ip accounting
- Show ip
- show logging
- show ip account

show interfaces ethernet Command

Router>*show interfaces ethernet 0*

Ethernet 0 is **up**, line protocol is **up**

Hardware is MCI Ethernet, address is **aa00.0400.0134** (bia 0000.0c00.4369)

Internet address is 131.108.1.1, subnet mask is 255.255.255.0

MTU 1500 bytes, **BW 10000 Kbit**, DLY 1000 usec, **rely 255/255**, **load 1/255**

Encapsulation ARPA, loopback not set, keepalive set (10 sec)

ARP type: ARPA, PROBE, ARP Timeout 4:00:00

Last input 0:00:00, output 0:00:00, output hang never

Last clearing of "show interface" counters 0:56:40

Output queue 0/40, 0 drops; input queue 0/75, 2 drops

Five minute **input rate** 6100 bits/sec, 4 packets/sec

Five minute **output rate** 1000 bits/sec, 2 packets/sec

2295197 **packets input**, 305539992 bytes, 0 no buffer

Received 1925500 broadcasts, 0 runts, 0 giants

3 input errors, **3 CRC**, 0 frame, 0 overrun, 0 ignored, 0 abort

0 input packets with dribble condition detected

3594664 **packets output**, 436549843 bytes, 0 underruns

8 output errors, 1790 collisions, 10 interface resets, 0 restarts

clear counters Command

Router> **show int s 1**

Serial1 is up, line protocol is up

Hardware is cxBus Serial

Description: 56Kb Line San Jose - MP

Internet address is 150.136.190.203, subnet mask is 255.255.255.0

MTU 1500 bytes, BW 56 Kbit, DLY 20000 usec, rely 255/255, load 1/255

Encapsulation HDLC, loopback not set, keepalive set (10 sec)

Last input 0:00:07, output 0:00:00, output hang never

Last clearing of "show interface" counters 2w4d

Output queue 0/40, 0 drops; input queue 0/75, 0 drops

Five minute input rate 0 bits/sec, 0 packets/sec

Five minute output rate 0 bits/sec, 0 packets/sec

16263 packets input, 1347238 bytes, 0 no buffer

Received 13983 broadcasts, 0 runts, 0 giants

2 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 2 abort

0 input packets with dribble condition detected

22146 packets output, 2383680 bytes, 0 underruns

0 output errors, 0 collisions, 2 interface resets, 0 restarts

1 carrier transitions

Router# **clear counters**

Using show cdp neighbors

```
routerA#show cdp neighbors
```

Capability Codes: R - Router, T - Trans Bridge,
B - Source Route Bridge,
S - Switch, H - Host, I - IGMP

Device ID	Local Intrfce	Holdtme	Capability	Platform	Port ID
routerB.cisco.com	Eth 0	151	R T	AGS	Eth 0
routerB.cisco.com	Ser 0	165	R T	AGS	Ser 3

```
routerA#show cdp neighbors detail
```

```
-----  
Device ID: routerB.cisco.com
```

```
Entry address(es):

Internet	172.19.168.254	0	0000.0c36.6965	ARPA	Ethernet0/0

Reachability and Step-by-Step Path Tests

Test reachability:

- ping ip

Test step-by-step path:

- trace

These tests operate in two levels:
user mode and privileged mode

ping Command (User) IP

```
R4#ping 10.36.195.1
```

```
Type escape sequence to abort.
```

```
Sending 5, 100-byte ICMP Echos to 10.36.195.1, timeout is 2 seconds:
```

```
!!!!
```

```
Success rate is 100 percent (5/5), round-trip min/avg/max = 4/4/8 ms
```

```
R4#ping 10.36.195.95
```

```
Type escape sequence to abort.
```

```
Sending 5, 100-byte ICMP Echos to 10.36.195.95, timeout is 2 seconds:
```

```
.....
```

```
Success rate is 0 percent (0/5)
```

ping Command (Privileged) IP

```
Router# ping  
Protocol [ip]:  
Target IP address: fred  
Repeat count [5]:  
Datagram size [100]:  
Timeout in seconds [2]  
Extended commands [n]: y  
Source address:10.36.195.148

Configuration Register Values

```
rommon> confreg 0x2142  
rommon> reset
```

Configuration Register Boot Field Value	Meaning
0x2142	Boot from flush <i>without</i> loading configuration
0x2102	Boot from flush <i>with</i> loading configuration

Boot to Setup Mode

--- System Configuration Dialog ---

Continue with configuration dialog? [yes/no]: y

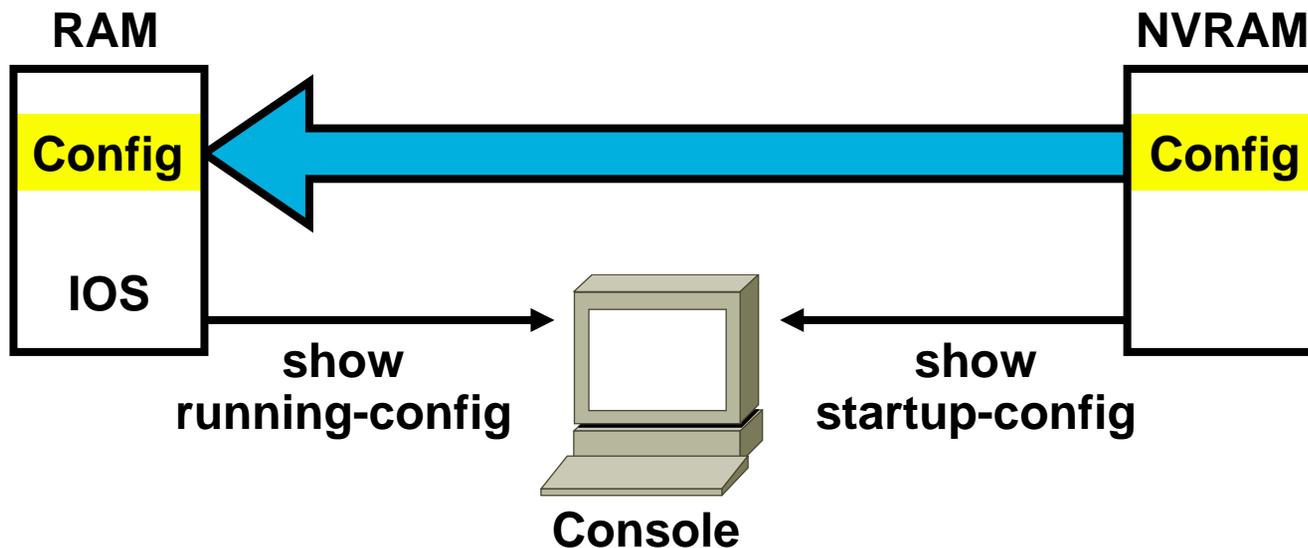

At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.

Basic management setup configures only enough connectivity
for management of the system, extended setup will ask you
to configure each interface on the system

Would you like to enter basic management setup? [yes/no]: n

Loading the Configuration

```
Roter>en  
Router#config memory  
or  
Rotuer#copy startup-config running-config
```

- Load and execute config from NVRAM

show running

In RAM

```
wg_ro#show running-config  
Building configuration...  
Current configuration:  
!  
version 12.0  
!  
-- More --
```

Configuration is restored !

Changing Enable Password

Enable Password

```
wg_ro(config) #enable secret cisco
```

- Old password cannot get back.
- Set a new enable password.

Enabling the Interfaces

Router#**show ip interface brief**

Interface	IP-Address	OK?	Method	Status	Protocol
Ethernet0/0	10.200.40.37	YES	TFTP	administratively down	down
Serial0/0	unassigned	YES	TFTP	administratively down	down
Ethernet0/1	unassigned	YES	TFTP	administratively down	down
Serial0/1	unassigned	YES	TFTP	administratively down	down

wg_ro **#configure term**

wg_ro (config)**#interface serial 0/0**

wg_ro (config-if)**#no shutdown**

%LINK-3-UPDOWN: Interface Serial0, changed state to up

%LINEPROTO-5-UPDOWN: Line Protocol on Interface Serial0, changed state to up

Enables an interface that are administratively shutdown

Configuration Register Values

```
wg_ro(config)#config-reg 0x2102  
wg_ro(config)#end
```

Configuration Register Boot Field Value	Meaning
0x2142	Boot from flush <i>without</i> loading configuration
0x2102	Boot from flush <i>with</i> loading configuration

Verifying Register Values

wg_ro#**show version**

Cisco Internetwork Operating System Software
IOS (tm) 2500 Software (C2500-JS-L), Version 12.0(3), RELEASE SOFTWARE (fc1)
Copyright (c) 1986-1999 by cisco Systems, Inc.
Compiled Mon 08-Feb-99 18:18 by phanguye
Image text-base: 0x03050C84, data-base: 0x00001000

ROM: System Bootstrap, Version 11.0(10c), SOFTWARE
BOOTFLASH: 3000 Bootstrap Software (IGS-BOOT-R), Version 11.0(10c),

wg_ro_a uptime is 20 minutes
System restarted by reload
System image file is "flash:c2500-js-l_120-3.bin"
(output omitted)
--More--

Configuration register is 0x2142 (*will be 0x2102 at next reload*)

Saving Configurations

```
wg_ro#telnet .....
```

```
wg_ro#write memory
```

```
Building configuration...
```

```
wg_ro#reload
```

- **Telnet to itself to double confirm.**
- **Copy the current configuration to NVRAM**

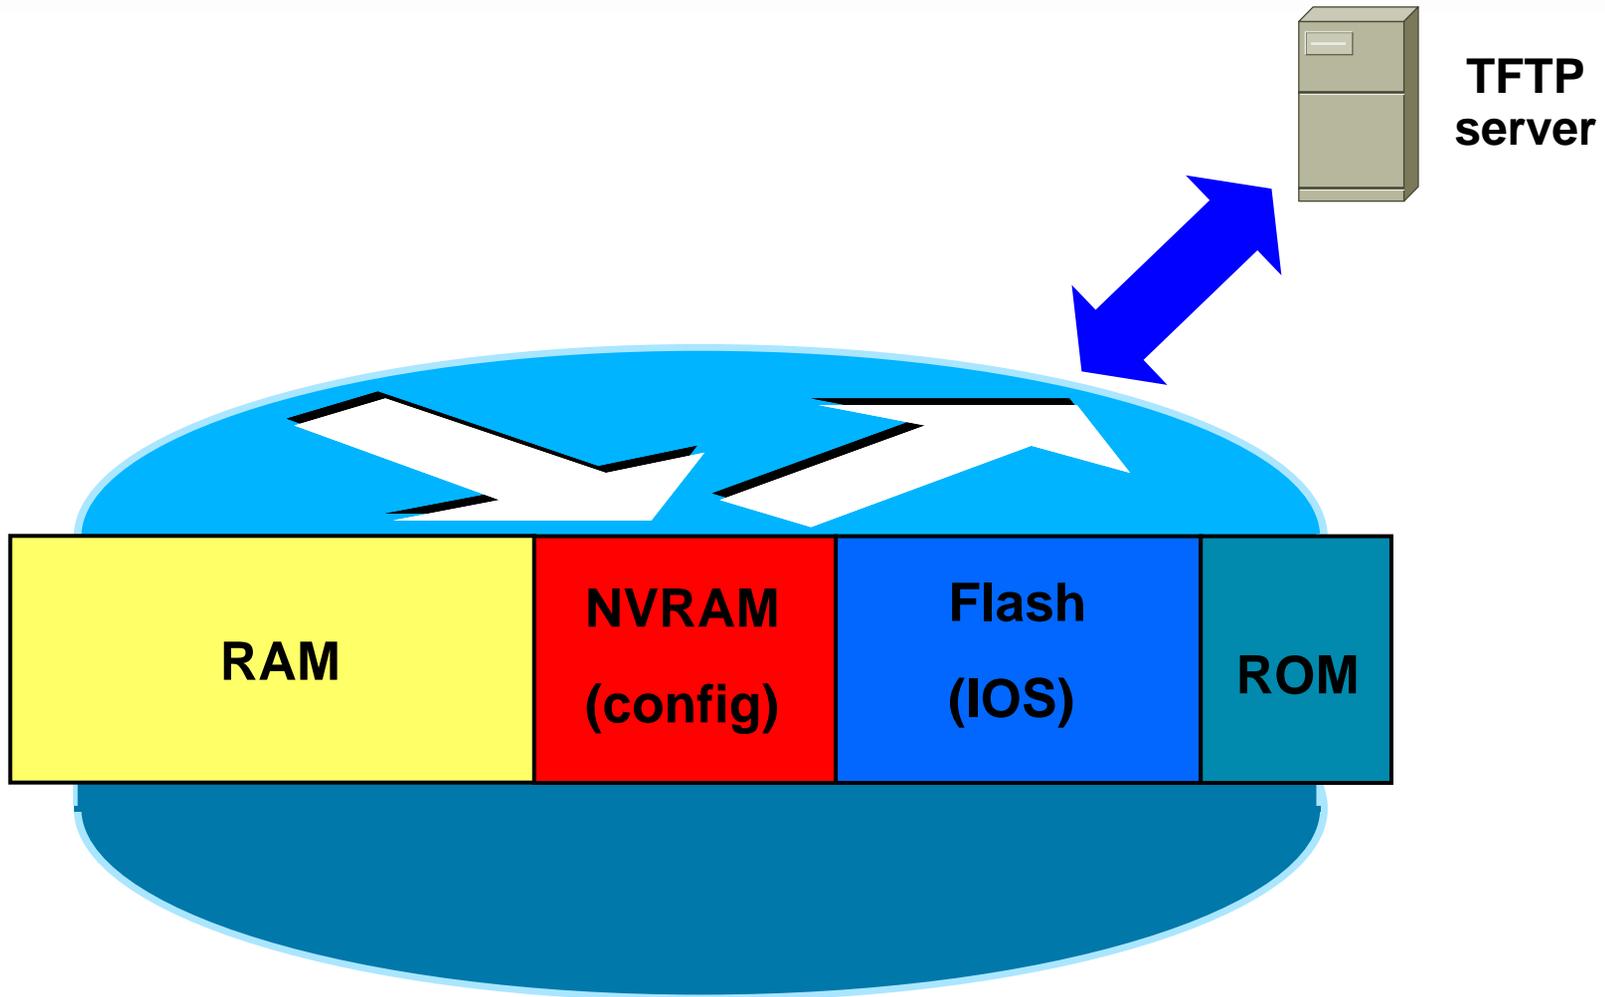

Summary

- **More password recovery procedure:**

IOS Backup & Upgrade

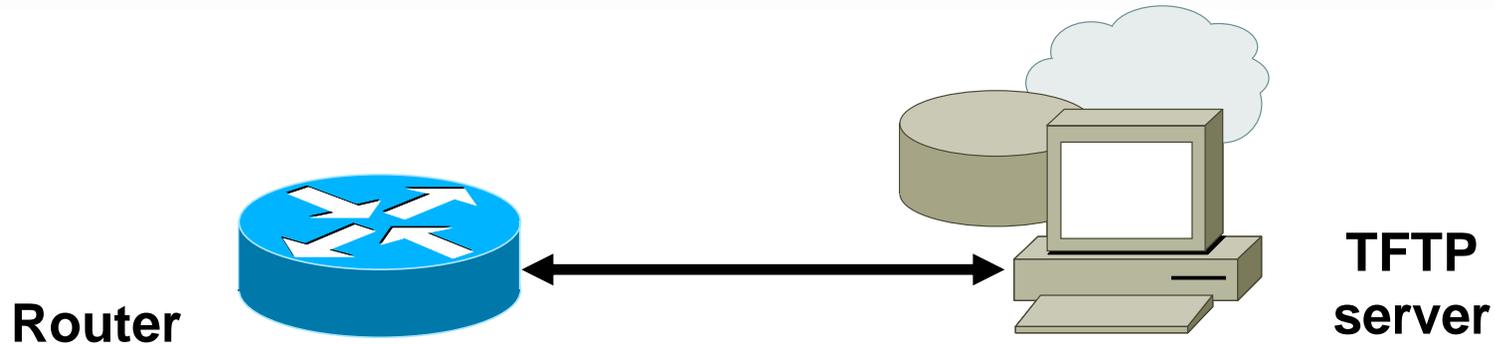

Cisco IOS File Systems and Devices

Managing IOS Images

Preparing for a Network Transmissation

- Check connectivity between router and tftp server
- Check flash/space available on the router/server
- Check file naming convention
- Create file on server if required
- TFTP utility

http://support.3com.com/software/utilities_for_windows_32_bit.htm

TFTP server

The screenshot shows the 3C Daemon TFTP server interface. The main window displays a table with the following data:

Start Time	Peer	Bytes	Status
Feb 18, 2004 14:21:43	local	0	Listening for TFTP requests on IP address: 10.36.195.148, Port 69

The configuration window is open to the 'TFTP Configuration' tab, showing the following settings:

- Create directory names in incoming file requests?:
- Allow overwrite of existing files?:
- Upload/Download directory: D:\Software\Cisco\
- Per-packet timeout in seconds (2-15): 5
- Maximum retries: 10
- Interframe transmission gap: 0

A blue arrow points from the text 'File directory' to the 'Upload/Download directory' field.

File directory

Verifying Memory and Deciphering Image Filenames

```
wg_ro#sh flash
```

System flash directory:

File	Length	Name/status
------	--------	-------------

1	10084696	c2500-js-l_120-3.bin
---	----------	-----------------------------

[10084760 bytes used, 6692456 available, **16777216 total**]

16384K bytes of processor board System flash (Read ONLY)

- Check the current IOS in flash memory.
- Verify Flash memory has room for the IOS image

show version Command

```
Wg_ro>show version
```

```
Cisco Internetwork Operating System Software
```

```
IOS (tm) C2600 Software (C2600-IS-M), Version 12.1(20), RELEASE SOFTWARE (fc2)
```

```
...
```

```
ROM: System Bootstrap, Version 11.3(2)XA4, RELEASE SOFTWARE (fc1)
```

```
...
```

```
System image file is "flash:c2600-is-mz.121-20.bin"
```

```
cisco 2611 (MPC860) processor (revision 0x202) with 26624K/6144K bytes of memory.
```

```
...
```

```
2 Serial(sync/async) network interface(s)
```

```
32K bytes of non-volatile configuration memory.
```

```
8192K bytes of processor board System flash (Read/Write)
```

- **Make sure flash and DRAM sizes meet the minimal requirement for IOS**

Upgrading the Image from the Net

```
wg_ro#copy tftp flash
Address or name of remote host []? 10.1.1.1
Source filename []? c2500-js-l_120-3.bin
Destination filename [c2500-js-l_120-3.bin]?
Accessing tftp://10.1.1.1/c2500-js-l_120-3.bin...
Erase flash: before copying? [confirm]
Erasing the flash filesystem will remove all files! Continue? [confirm]
Erasing device... eeeee (output omitted) ...erased
Erase of flash: complete
Loading c2500-js-l_120-3.bin from 10.1.1.1 (via Ethernet0): !!!!!!!!!!!!!!!!!!!!!!!
(output omitted)
[OK - 10084696/20168704 bytes]
Verifying checksum... OK (0x9AA0)
10084696 bytes copied in 309.108 secs (32636 bytes/sec)
wg_ro#reload
```

Define a Booting IOS file

```
wg_ro#sh flash:
```

System flash directory:

```
File Length Name/status
```

```
1 7724588 c2600-i-mz.121-20.bin
```

```
2 9923856 c2600-is-mz.121-20.bin
```

```
wg_ro#config t
```

```
wg_ro(config)#boot system flash c2600-is-mz.121-20.bin
```

- New IOS will take effect after reload.

Creating a Software Image Backup

```
wg_ro#copy flash tftp
Source filename []? c2500-js-l_120-3.bin
Address or name of remote host []? 10.1.1.1
Destination filename [c2500-js-l_120-3.bin]?
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
<output omitted>
10084696 bytes copied in 709.228 secs (14223 bytes/sec)
wg_ro#
```

- **Back up current files prior to updating Flash**

Backup Configuration

wg_ro_a#*copy running-config tftp*

Address or name of remote host []? 10.1.1.1

Destination filename [running-config]? wgroa.cfg

!!

1684 bytes copied in 13.300 secs (129 bytes/sec)

wg_ro_a#*copy tftp running-config*

Address or name of remote host []? 10.1.1.1

Source filename []? wgroa.cfg

Destination filename [running-config]?

Accessing tftp://10.1.1.1/wgroa.cfg...

Loading wgroa.cfg from 10.1.1.1 (via Ethernet0): !

[OK - 1684/3072 bytes]

1684 bytes copied in 17.692 secs (99 bytes/sec)

Q & A

Thanks you !
